Since 2008

<https://www.synchrotron-soleil.fr/en/beamlines/swing>

- **Small and Wide angle X-ray scattering**

From macromolecule to material.

- Hard X-rays Energy (U20 undulator): 5 keV to 16 keV (wavelength: 2.5 Å to 0.75 Å)
- Usual beam size (FWHM): 25-400 (H) x 25-100 (V) μm²
- Structural information from non-crystalline samples (scale: nm to μm)

Protein conformations

Roudenko O., Thureau A. & Pérez J., March 2018
 Petrella, S., et al. (2019). *Structure*, 27, 579–589.

Deformation under strain

Phase transition of lipids/ liquid crystals

Experimental Hutch

Optical Hutch

Tunnel under vacuum with X-rays detector

X,Y and Z motorized table

Double crystals mirror

Monochromator

Sample environment dedicated to the biology:

SEC-HPLC device

SEC-SAXS

SAXS cell vacuum chamber

Details of the SAXS cell

Quartz capillary

Microfocus set-up

Scanning **SAXS** cartography
 2D scattering/diffraction maps (spatial resol 25 μm)
 Sample size: a few mm

Local ultrastructure of Bone sarcoma Slice ~100 μm thick

A. Bardouil, F. Artzner *et al.*, submitted.

Nanoprobe set-up

Ptychography **X**-rays **C**omputed **T**omography

Based on diffraction from a **coherent X-rays** beam

3D density maps at high spatial resolution (< 50 nm)

Sample size : 10 – 30 μm

Dentin high resolution density map Dentinogenesis Imperfecta study (cyl. \varnothing 15 μm)

- High-throughput injecting robot
 - Duty cycle : 3'30"
 - Injection / measurement / cleaning / drying
 - Injection volumes 10 to 50 μL
 - No dilution effect : [0.2 – 2 mg/mL]

~ 170 μL of tubing from injection to SAXS capillary

- 👎 Wetting effect induce loss of sample volume
- 👎 Difficulties for injecting viscous samples
- 👎 Cleaning and drying take time
- 👎 Cross contamination might occur

Ideally : Directly inject the sample into the capillary

0 μL of tubing from injection to SAXS capillary

- 👍 No sample loss
- 👍 Faster Cleaning and Drying process
- 👍 Viscous samples are allowed
- 👍 No cross contamination

ISAC Support Group @ SOLEIL (Laura Muñoz)

anr DeepSAXS

+ Automatic switch with SEC-SAXS mode

- ✓ Short presentation of current available techniques at beamline SWING

- ✓ Short conclusion: foreseen new functionalities for Memprot and Dadimodo

- SAXS is good at monitoring conformation changes
- Membrane proteins undergo conformational changes

- How can we use SAXS to monitor membrane proteins conformation changes ?
- How can we use SAXS with a membrane protein of known structure ?

Crystalline lens (eye)

AQP0 (ex-MIP)
60 % of the membrane protein content

Natively tetramer
Water transport across cell membranes

- ✓ Two types of known existing states
- ✓ 3D already obtained

Full AQP0, from cortex
→ **Tetramer**

Truncated AQP0, from core
→ **Octamer**

Gonen et al., Nature 2004

Purification of Full AQP0

- From bovine eye to lens membrane

- From lens membrane to AQP0 in solution
- Detergent:
Dodecyl- β -D-maltopyranoside (DDM)
- ✓ Concentration reached **4 mg/ml** (2ml)

2 problems for SAXS:

- **Mixture**
- **Detergent belt**

- Mixture problem solved with the HPLC

SEC-HPLC / SAXS combination

- ✓ Prevents the aggregates in the sample
- ✓ Subtraction of free micelles of detergent

From Refractive Index & UV abs (280nm)

$$\phi = \frac{OD \times (dn/dc)_{Det}}{\epsilon_{AQP0}} \times \left[RI - \frac{OD \times [(dn/dc)_{Prot} - (dn/dc)_{Det}]}{\epsilon_{AQP0}} \right]^{-1}$$

$$N_{Det} = \frac{1-\phi}{\phi} \times \frac{M_{Prot}}{M_{Det}}$$

$N_{Det} = 238 \pm 15$ molecules per protein

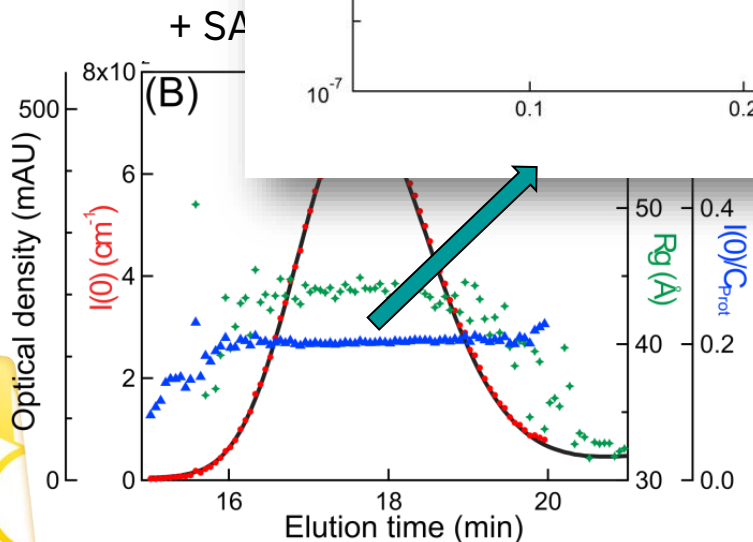

+ SAXS $\rightarrow I(0)$ & R_g

$$\frac{I(0)}{C} = M \cdot \frac{r_e^2}{N_A} \left(\frac{n_e N_A}{M} - \rho_0 \bar{v} \right)^2$$

\Rightarrow **M** is constant
 \Rightarrow No depletion of detergent
 \Rightarrow Monodisperse solution

$$N_{Det} = \frac{\sqrt{\frac{I(0)M_{prot}N_A}{C_{prot}f^2} - (n_{prot}N_A - \rho_S \bar{v}_{prot}M_{prot})}}{(n_{det}N_A - \rho_S \bar{v}_{det}M_{det})}$$

$N_{Det} = 225 \pm 25$ molecules per protein

Several electronic densities : protein/detergent

Simple ~~Ab initio~~ method

A parametrized torus with two electronic densities

The torus volume is filled with beads.
The SAXS curve is calculated with CRY SOL

Beads « atoms » and grid parameters
chosen for Crysol input :

$$\rho_{\text{tails}} = 0.282 \text{ \AA} \rightarrow \text{Leu/CD2}$$

$$\rho_{\text{heads}} = 0.520 \text{ \AA} \rightarrow \text{Lys/NZ}$$

Lipfert et al. (2007), Phys.Chem.B, 111, 12427–12438

Core-shell ellipsoid

$A = 22 \text{ \AA}$

$B = 18.2 \text{ \AA}$

$T = 5 \text{ \AA}$

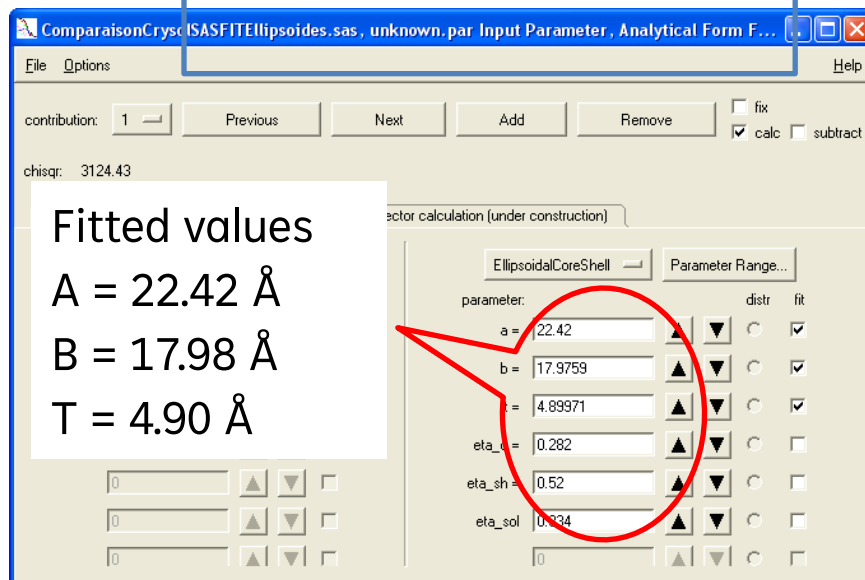

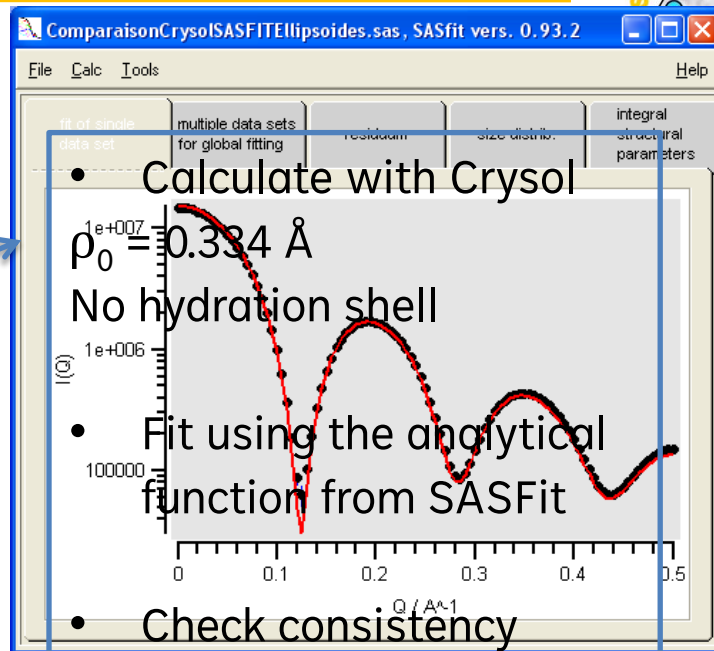

Beads « atoms » and grid parameters chosen for Crysol input :

$$\rho_{in} = 0.282 \text{ e}^-/\text{\AA}^3$$

$$\rho_{out} = 0.520 \text{ e}^-/\text{\AA}^3$$

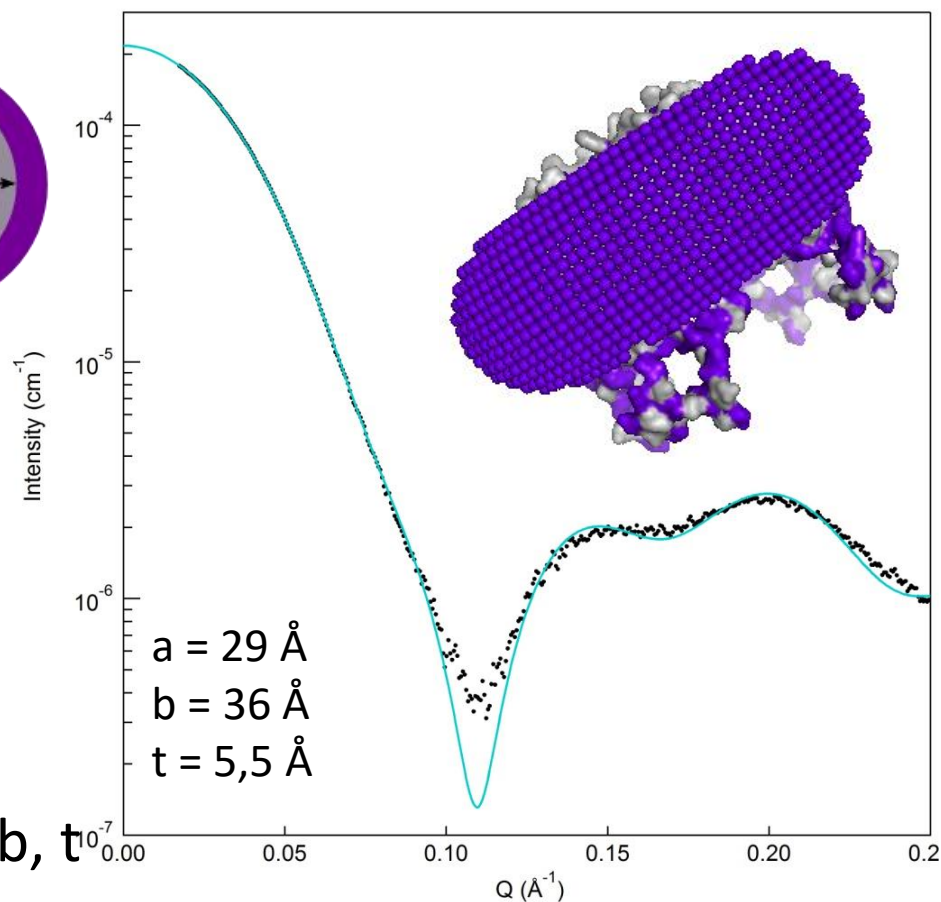

Validated

Modelization of a circular torus of detergent

Three free geometric parameters, a , b , t

Berthaud et al. (2012), *JACS*, 134 (24), 10080-10088

Addition of the ellipticity
parameter : e

$a = 30 \text{ \AA}$
 $b = 35 \text{ \AA}$
 $t = 5.5 \text{ \AA}$
 $e = 1.12$

Relevancy of the model

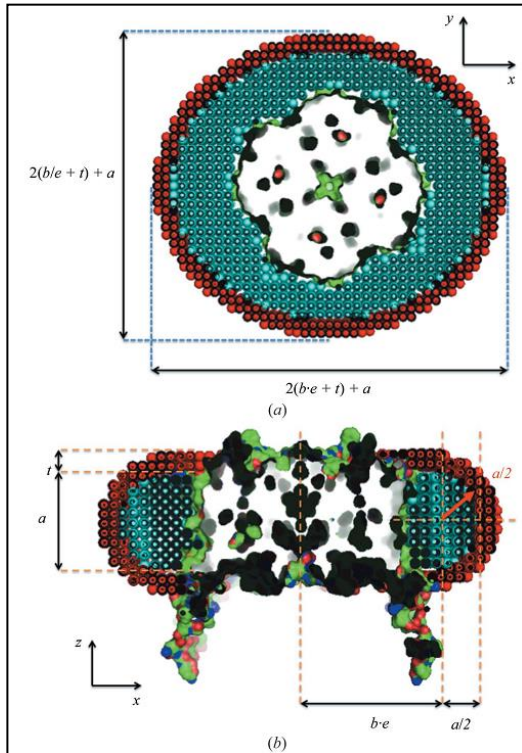

Number of detergent molecules from the
coarse grain model by volume's calculations:

$N = 270 \pm 30$ detergent molecules

⇒ Good agreement with previous values !

Pérez J. & Koutsioubas, A. (2015), *Acta Cryst.*, D71, 86-93

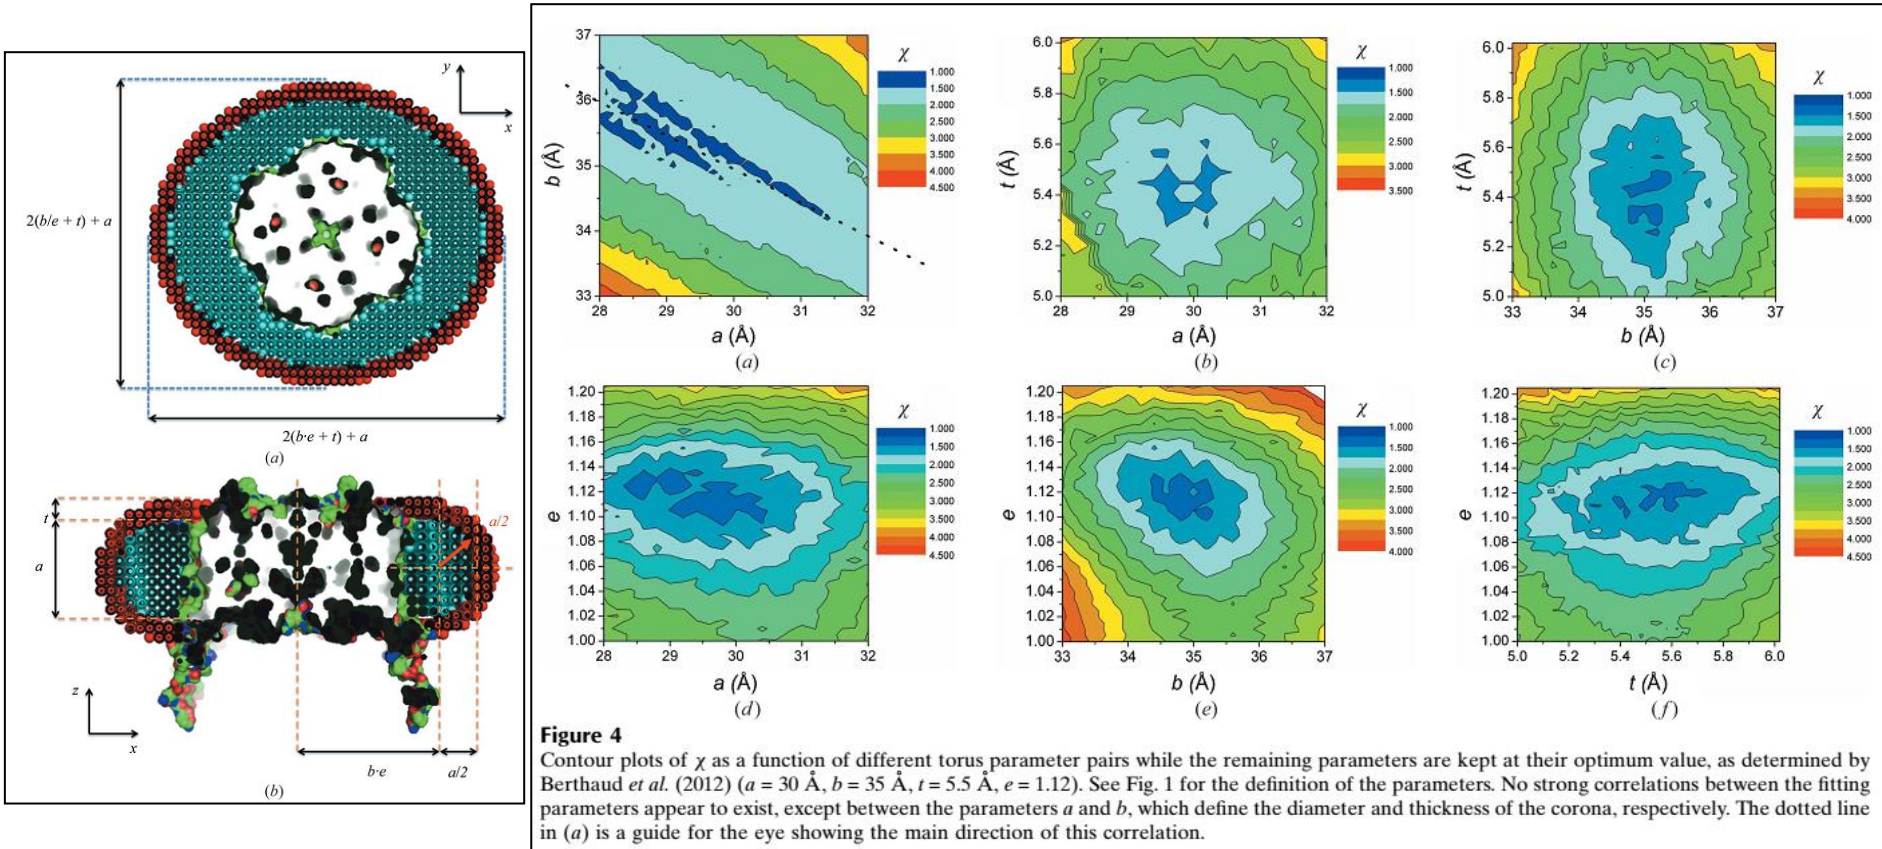

```

minimum_chi ← infinite
for each a in the range [a_min,a_max], do
  for each b in the range [b_min,b_max], do
    for each t in the range [t_min,t_max], do
      for each e in the range [e_min,e_max], do
        for each phi in the range [phi_min,phi_max], do
          generate corona_model(a,b,t,e,phi)
          calculate chi (corona, protein pdb, experimental data) calling CRY SOL
          if minimum_chi > chi, then
            minimum_chi ← chi
return chi
  
```

Algorithm of the *Memprot* program. The program essentially creates PDB files with the models made of the full-atom protein structure and the parameterized coarse-grained detergent corona, and *CRY SOL* is called to calculate the SAXS curves. An overall sorting on the χ value is performed to keep the best model.

$$\chi^2 = \frac{1}{N} \sum_{i=1}^N \left[\frac{I_{exp}(q_i) - I_{calc}(q_i)}{\sigma(q_i)} \right]^2$$

Pérez J. & Koutsioubas, A. (2015), *Acta Cryst.*, D71, 86-93

$$\chi^2 = \frac{1}{N} \sum_{i=1}^N \left[\frac{I_{exp}(q_i) - I_{calc}(q_i)}{\sigma(q_i)} \right]^2$$

Full Aqp-0
(2b6p)Truncated Aqp-0
(2b6o)**Figure 7**

Scattering curves corresponding to corona parameters $a = 29.6 \text{ \AA}$, $b = 35.4 \text{ \AA}$, $t = 5.6 \text{ \AA}$, $e = 1.12$, $e'_{\text{heads}} = 0.512 \text{ e \AA}^{-3}$, $e'_{\text{tails}} = 0.270 \text{ e \AA}^{-3}$ for the full (2b6p) and truncated (2b6o) structures of aquaporin-0. The respective χ values are 1.31 and 3.79. The curve corresponding to an artificial optimized corona using the truncated form of aquaporin-0 is also plotted. The associated χ value is 3.47, which is still much higher than that for the complex based on the actual 2b6p structure.

***B. halodurans* multi-hydrophobic amino acid transporter MhsT – bacterial SLC6 transporter**

The **SLC6 family** of secondary active transporters:

- **integral membrane** solute carrier proteins
- Na⁺-dependent **translocation of small amino acid** or amino acid-like substrates
- includes the serotonin, dopamine, norepinephrine, GABA, taurine, creatine
- associated with a number of human diseases and disorders making this family a **critical target for therapeutic development**
- several members **directly involved in the action of drugs of abuse such as cocaine, amphetamines, and ecstasy.**

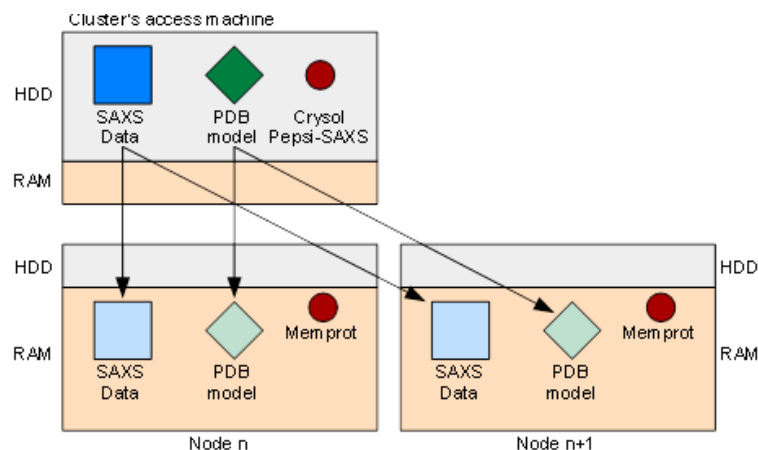

(coll: Poul Nissen, Aarhus University, Denmark)

- Typical Memprot runs range from thousands to hundreds of thousands of trials – the speed of calculations and scalability is an important issue
- We have implemented MPI-based, data-driven parallelization in Memprot to benefit from HPC clusters (here SOLEIL HPC)
- 449 residue protein MHST (PDB id 4us3) was used as a test case (sample provided by collaborators and measured at SWING)
- To prevent saturation of the cluster's network, Memprot stores all i/o files (experimental data, protein's PDB model, intermediate files) locally in the node's RAM, utilising /dev/shm partition

64 cores x 2.65 GHz
→ 1 min for 1000 models

(coll: Poul Nissen, Aarhus University, Denmark)

Fit 1

Fit 2

Fit 3

De Pol et al., submitted

In principle, N_{tails} should be equal to N_{heads} !

In practice, not always exactly the case.

A scoring function was designed to account for this constraint:

$$S = (1 + |1 - \alpha| + |1 - ToH|) * \chi^2, \text{ where } ToH = N_{tails} / N_{heads}$$

De Pol et al., submitted

De Pol et al., submitted

Case of MhsT-DDM, MhsT-DM

✓ Can be well modelled by a flat hemi-torus

Case of MhsT-Cymal-4 and MhsT-DMNG

VS

✗ Can be only approximated by a flat hemi-torus

A "bicelle-like" model should be implemented in the future

- ✓ Short presentation of current available techniques at beamline SWING
- ✓ Memprot program: why and how
 - AQP0 as the « Guinea pig » protein*
- ✓ Example of a recent application using Memprot:
 - MHST protein in 4 different detergents*
- ✓ **Dadimodo program: why and how**
- ✓ Example of application coupling Memprot & Dadimodo:
 - HasA-HasR protein with two different constructs*
- ✓ Short conclusion: foreseen new functionalities for Memprot and Dadimodo

Evrard et al. (2011), *J. Appl. Cryst.*

Modelling approach : complete atomic model

Full structure initiated with :

- Crystal or NMR domain structures
- Homology models

Prior knowledge:

- Sequence
- Sub-parts moved as rigid-bodies (user-defined)
- A correct stereochemistry is maintained at all steps by minimizing energy

Experimental data:

- SAXS
- NMR RDC

ADR (chem. shift map.)

SAXS score

RDC score

ADR score

Optimisation of the **all-atom** structure *via* a genetic algorithm

- Initial (slow) version : Evrard et al. (2011), *J. Appl. Cryst.*, 44:1264-1271.
- Current (faster) version : O. Roudenko , A. Thureau, J. Pérez (2019), *GECCO '19, ACM, NY, USA*, 401-402.
 - Parallel implementation of the genetic algorithm
 - 7300 Atoms → 7 hours on a 20 processor node (200 generations)
 - User-friendly input
 - Tools for completion of pdb input files (if needed)
 - User-defined topology : Pdb file + rigid bodies definitions
 - Web server since end 2018
 - Accessible to external users (after login in Soleil DB)
 - Five independent runs launched in parallel

A. Sali & T.L. Blundell. Comparative protein modelling by satisfaction of spatial restraints. *J. Mol. Biol.* 234, 779-815, 1993.

About

DADIMODO is a program for refining atomic models of multidomain proteins or complexes against small-angle X-ray scattering data. Domain structures are mainly kept rigid and can be user defined. Stepwise generic conformational changes are applied cyclically in a stochastic optimization algorithm that performs a search in the protein conformation space. The algorithmic structure guarantees that a physically acceptable full atomic model of the structure is present at all stages of the optimization. How To Use It

Three input files have to be uploaded

- The configuration file, where the rigid body domains are defined.
- A PDB file with **all the atoms** of the initial guess protein structure.
- A file with SAXS experimental data with three columns q , $I(q)$, $\Sigma(q)$, with q in Å^{-1} .

One DADIMODO run taking several hours, you will be notified by email as soon as your calculation is completed.

Origins and Dependencies

The DADIMODO you run when using the present web interface has its roots in [1, 2]. It calls MMTK [3] for the chemical structure manipulations and CRY SOL [4] for the calculation of the simulated SAXS curves. Compared to its predecessor, the new DADIMODO offers two main advantages. The first one is

SOLEIL INEXT

CONF file * example
PDB file * example
SAXS file * example

Dadimodo

- Better stop criteria (different from number of generations)
- More friendly output for each run (plot figures,...)
- Summary file for all runs (classification of individual results)
- ADR constraints available on WebServer version (currently only available on local version)

Memprot

- Commissioning of other geometries (bicelles & nanodiscs)
- Web server for direct access by users (currently only staff can use the HPC)
