The environmental impact of the ISIS-II Neutron and Muon Source

Dr. Hannah Wakeling

Seminar at ESS

18th January 2024

John Adams Institute for Accelerator Science

University of Oxford

Science and Technology Facilities Council

ISIS Neutron and Muon Source

Overview

1) The intersection of physics and the Climate Crisis
2) The ISIS-II Neutron and Muon Source
3) Environmental Impact & Life Cycle Assessment of ISIS-II
    - Methodology
    - Preliminary Results

The Climate Crisis

is not going away

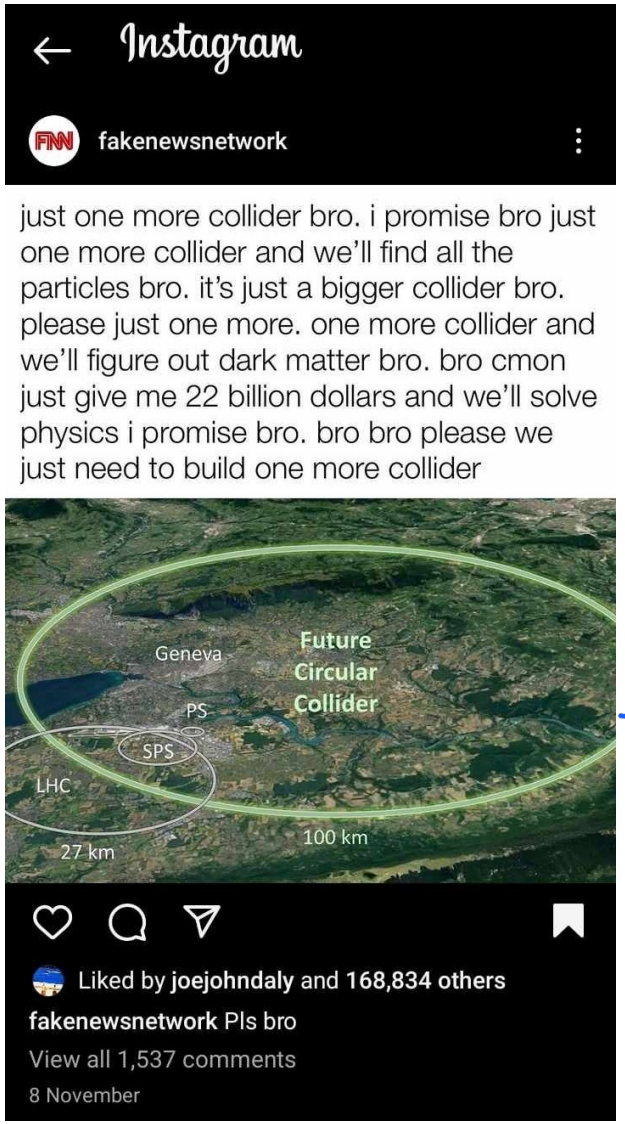
Why do we as physicists, engineers, researchers, etc. need to care?

- Moral and social duty to lead by example.
- Publicly funded.

What do we really mean by environmental impact and "sustainability"?

- Sustainability is "a social goal for people to co-exist on Earth over a long time."

- How does this *actually* relate to the field of physics?



Instagram: @fakenewsnetwork

The climate issue | Nature Astronomy

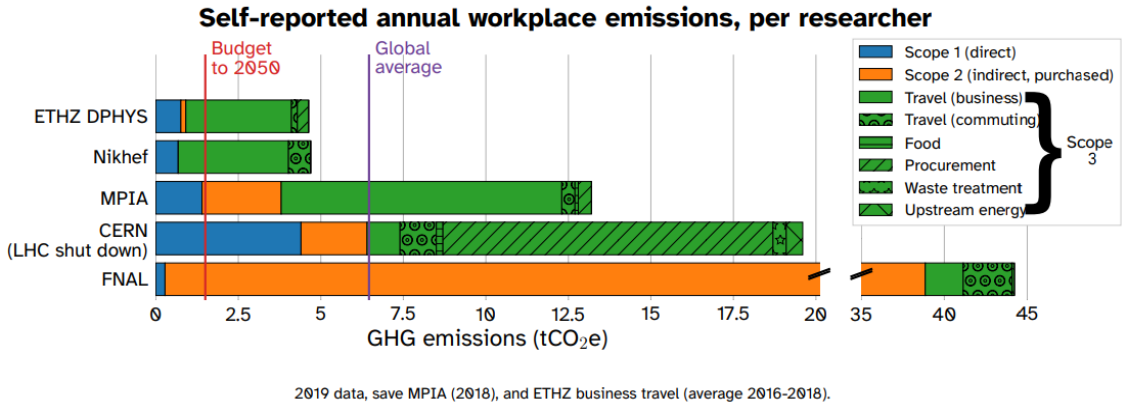
The environmental impact of particle accelerators

Large accelerator facilities are generally unsustainable:

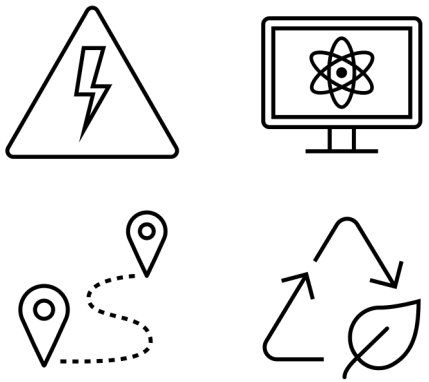
- resource consumptive, and
- next generations aim to grow in size and/or power, and therefore (generally) consumption.

Many efforts ongoing around the world:

- Carbon emissions and impact reports,
- R&D for increased efficiency of machines (klystrons, cryo., etc.),
- Reduction in resource consumption (helium, etc.),
- Sustainability guidelines,
- Air-travel reduction,
- And more...



Reported workplace GHG emissions[1].

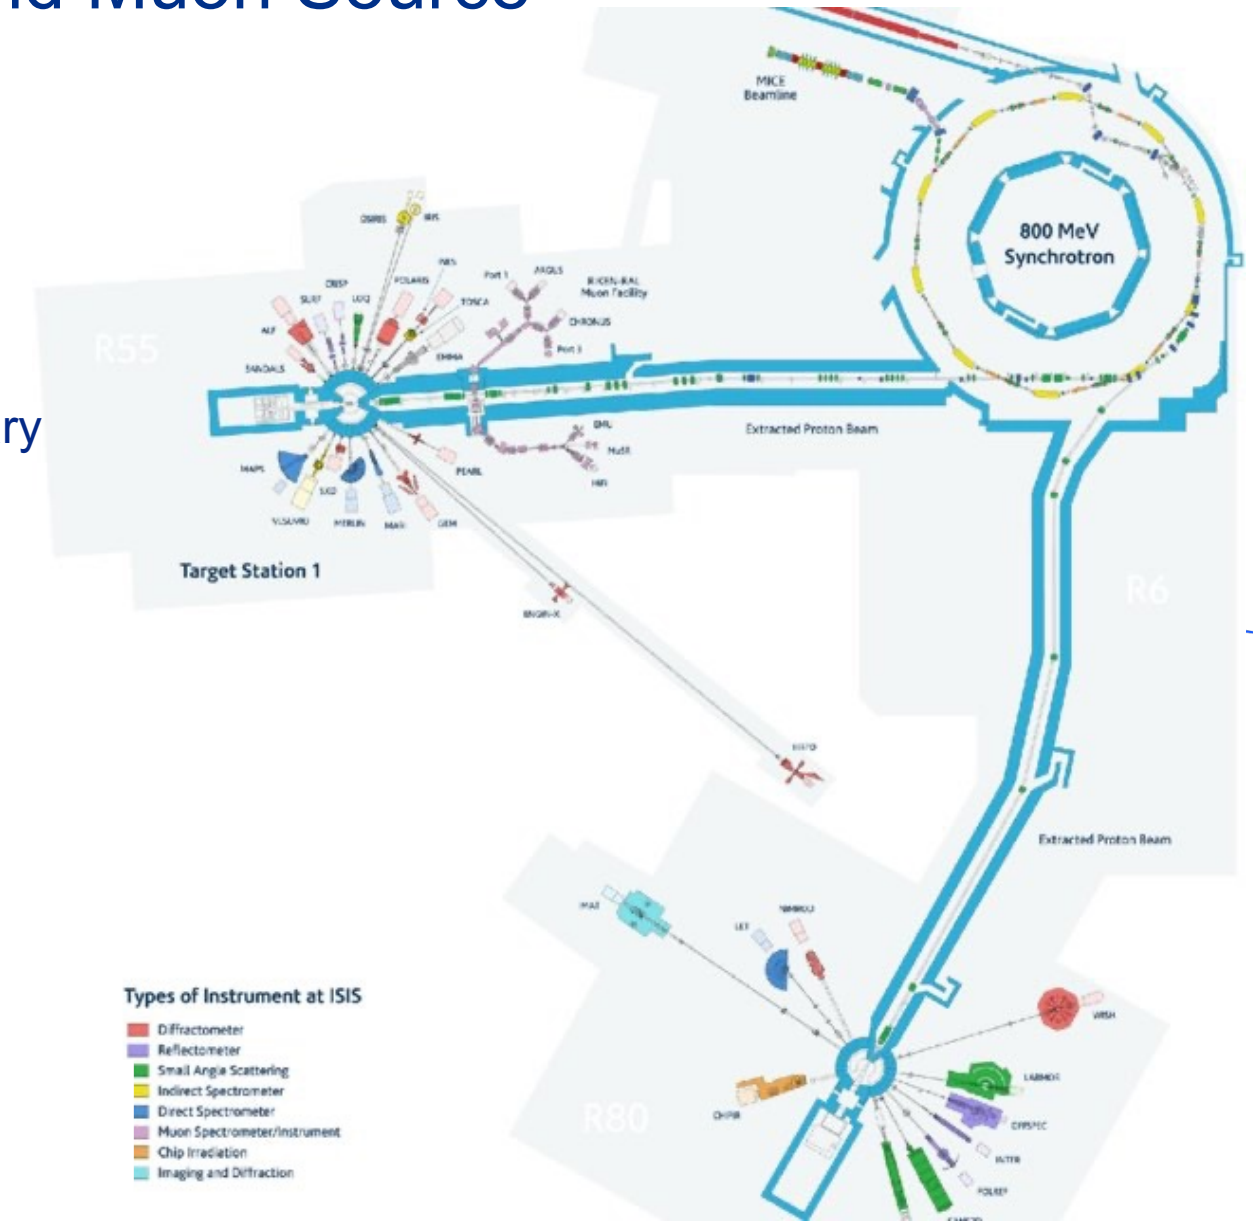


[1] Environmental sustainability in basic research: a perspective from HECAP+

The ISIS-II Neutron and Muon Source

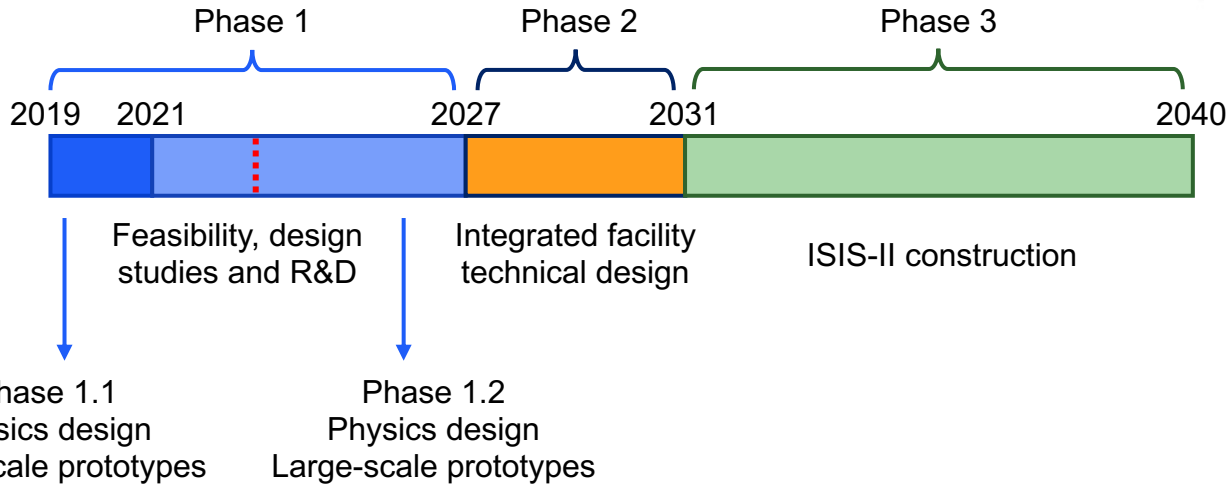
The ISIS Spallation Neutron and Muon Source

- ISIS is the UK's two target, pulsed spallation source that produces world leading science.
- Based at the STFC Rutherford Appleton Laboratory (RAL), Oxfordshire, UK.
- This year, ISIS marks it's 40th year anniversary since neutrons!



The ISIS-II Neutron and Muon Source

- The proposed 1.2 GeV beam upgrade to the ISIS Neutron and Muon Source.
- Two target stations.



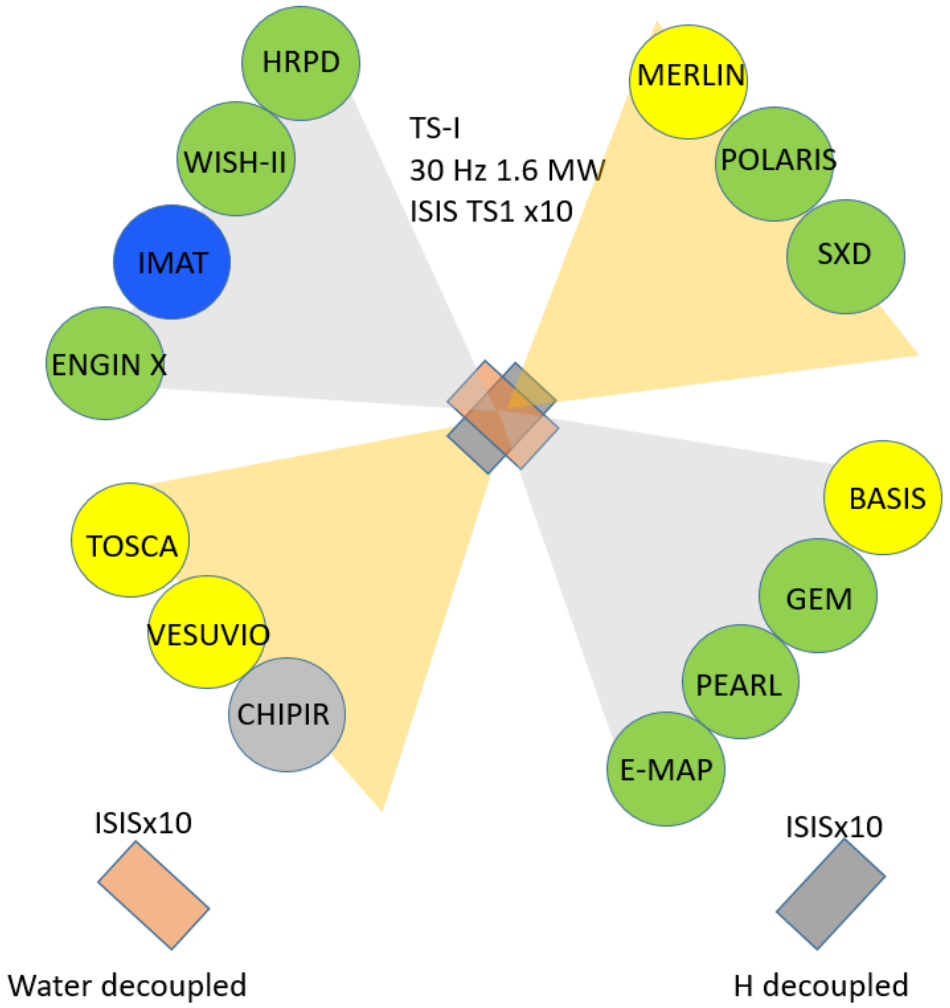
Proposed ISIS-II timeline.

One proposed design option for ISIS-II.

Progress on Design Studies for the ISIS II Upgrade (2019)

High repetition rate target options

- New 30 Hz 1.6 MW target station.
- High resolution
  - Same or better resolution as current TS1 at ISIS.
- Expect gains to be proportional to power.
- Decoupled water and hydrogen moderators.
- Flux gain of 10 over current TS1 at same resolution.

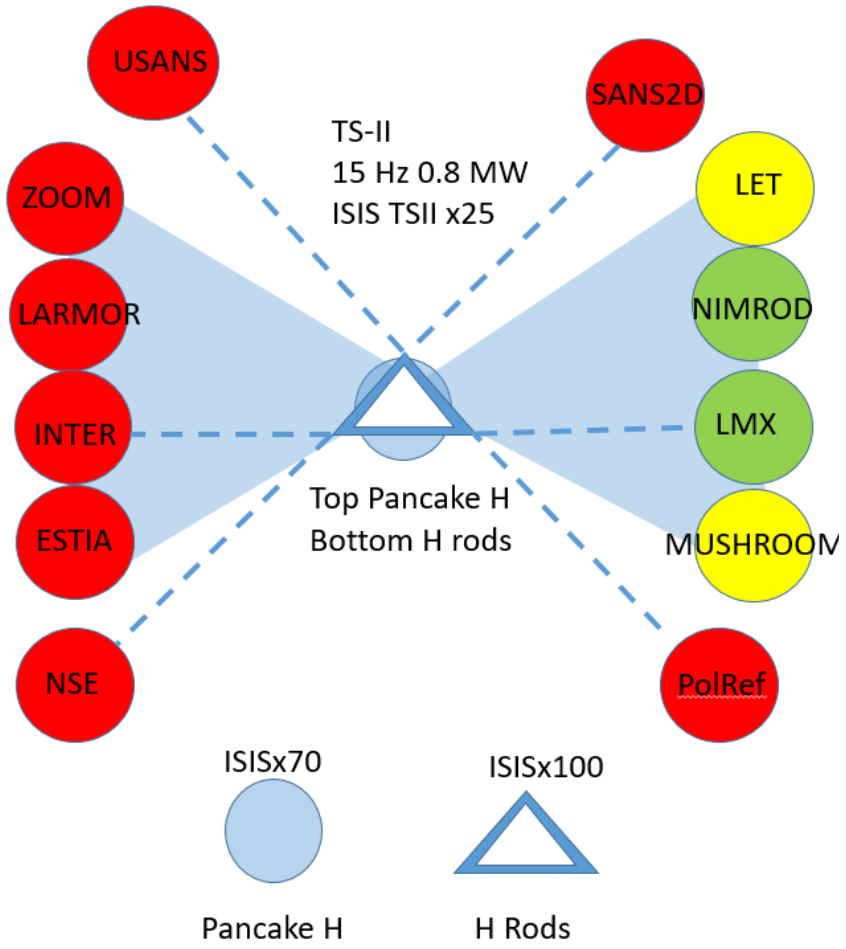


Proposal of TS1 instruments.

Thanks to Dr. John Thomason for these slides.

Low repetition rate target options

- TS2 - 15 Hz 0.8MW.
- TS2 would focus on cold neutrons and high brightness.
- The preliminary concept looks a lot like SNS Second Target Station, ORNL.
- Flux gain of 70-100.
- There are several options for muon production, such as intermediate targets or standalone stopping targets.

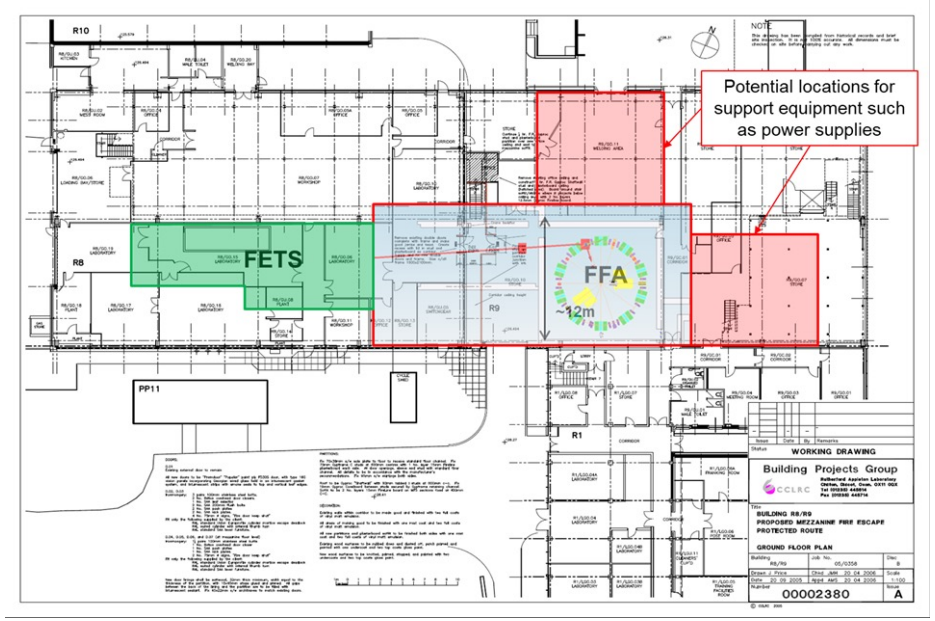


Proposal of TS2 instruments.

Thanks to Dr. John Thomason for these slides.

ISIS-II project phase 1.2b plan

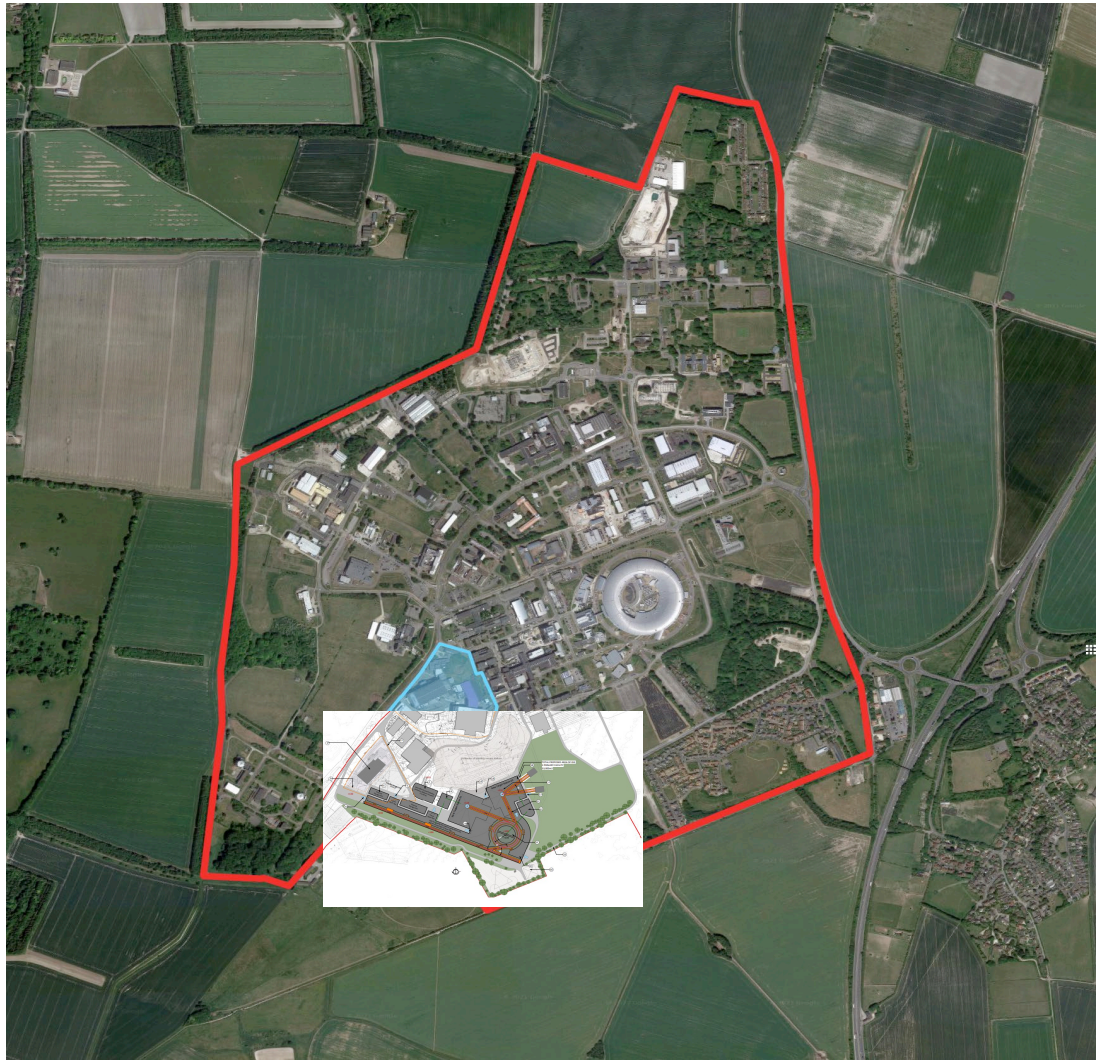
- Construction of a small FFA test ring on the end of the Front End Test Stand (FETS) at RAL in order to explore the beam dynamics fully.
- Completion of compression ring designs.
- Linear accelerator design integrated with choice of pulse compression ring.
- Completion of target, moderator and shielding design for high and low repetition rate neutron targets and a muon target.
- Production of an optimal concept design with credible initial cost estimates.



Proposal of ISIS-II FFA drawing.

Thanks to Dr. John Thomason for these slides.

What might ISIS-II look like?



Proposal of ISIS-II "Green Field" location at RAL

Thanks to Dr. John Thomason for these slides.

The environmental impact and Life Cycle Assessment of ISIS-II

January 2024 | Dr. H. M. Wakeling

What do we hope to achieve?

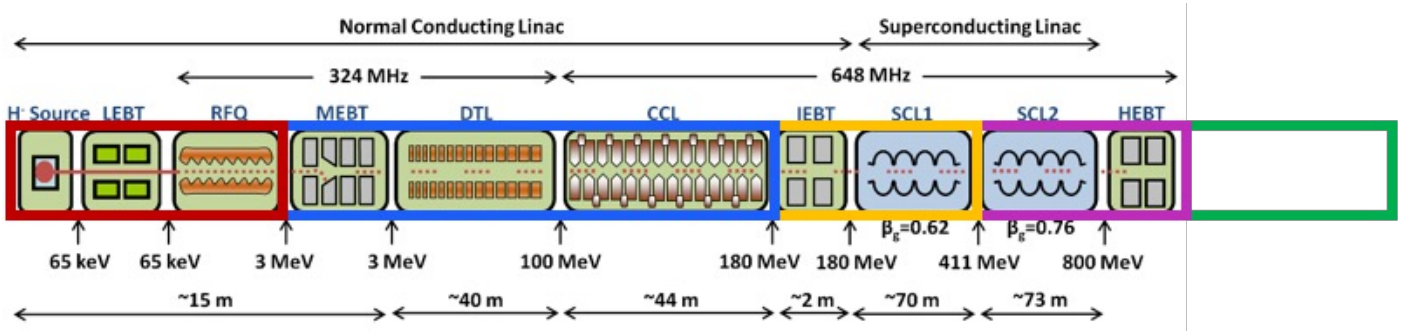
- To inform ISIS-II design options.
- To report on the full lifetime environmental impact expected at ISIS-II.
- To identify hotspots of environmental impact to allow focus to reduce these impacts.
- To help develop a methodology that can be used by other future facilities.

Methodology

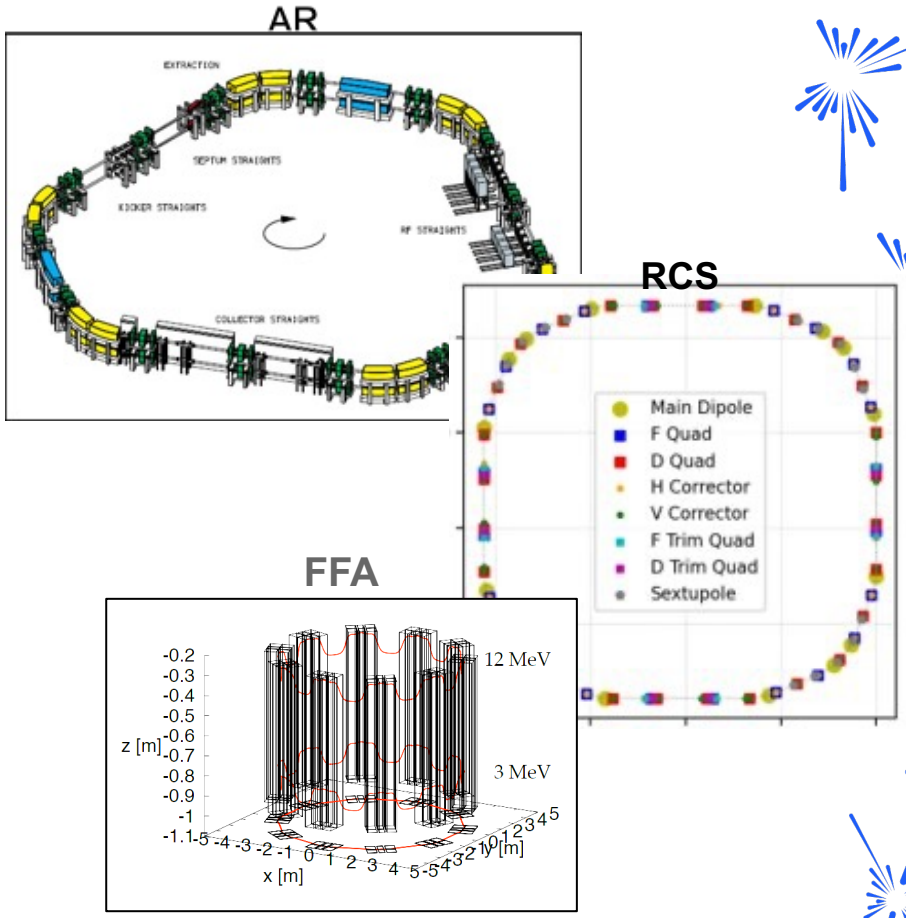
How can we achieve that?

Two key stages to this analysis:

1. Core components of ISIS-II and an estimation of their environmental impact through modelling and simulation.
2. (Simplified) **Life Cycle Assessment** (LCA)
   - to compare the compression ring options for ISIS-II, to inform ISIS-II phase 1.2b bid



LINAC design proposal.



3 ring options for ISIS-II.

A first look at the environmental impact of ISIS-II

Disclaimer:

- Assumptions, assumptions, assumptions!
- Models updated very regularly.
- Studies ongoing and future studies to come!

ISIS-II Components

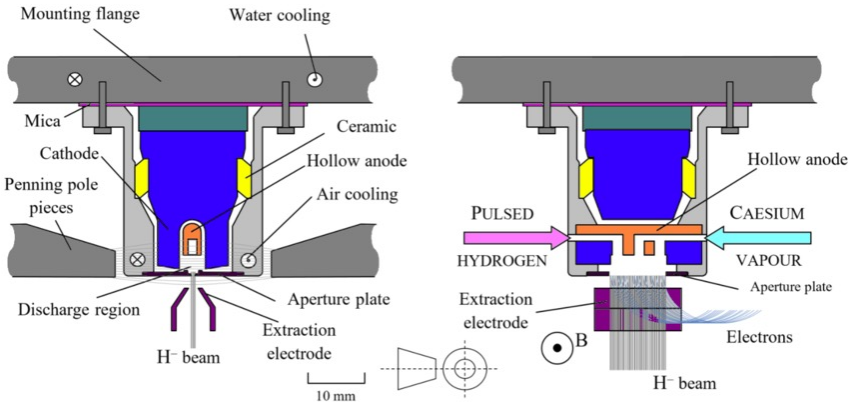
(many of the most common components of accelerators)

- Source and pre-injector
- Acceleration:
  - LINAC
  - **Compression Ring (Options)**
- Extraction: Extraction Proton Beamlines (EPBs)
- Collision: Target(s)
- Measurements: Instruments

- Ancillaries

Ion Source and pre-injector

- Assuming ISIS H- Penning ion source
- Modelled using Front End Test Stand (FETS) at RAL



Tarvainen, Olli & Faircloth, Dan & Lawrie, Scott. (2023) 10.1088/1748-0221/18/05/C05023.

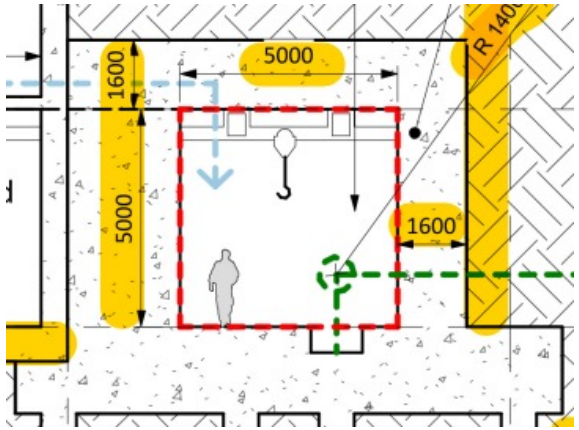
Example: machining of materials potentially optimizable

- FETS RFQ
- 16 blocks of oxygen-free copper totalling 4 tonnes
- Machined to16 vanes: 8 major (80kg ea), 8 minor (20kg ea)
- 3.2 tonnes of copper, i.e. 80%, wasted.
  - Swarf and off cuts were recycled via commercial metal recycling.

LINAC

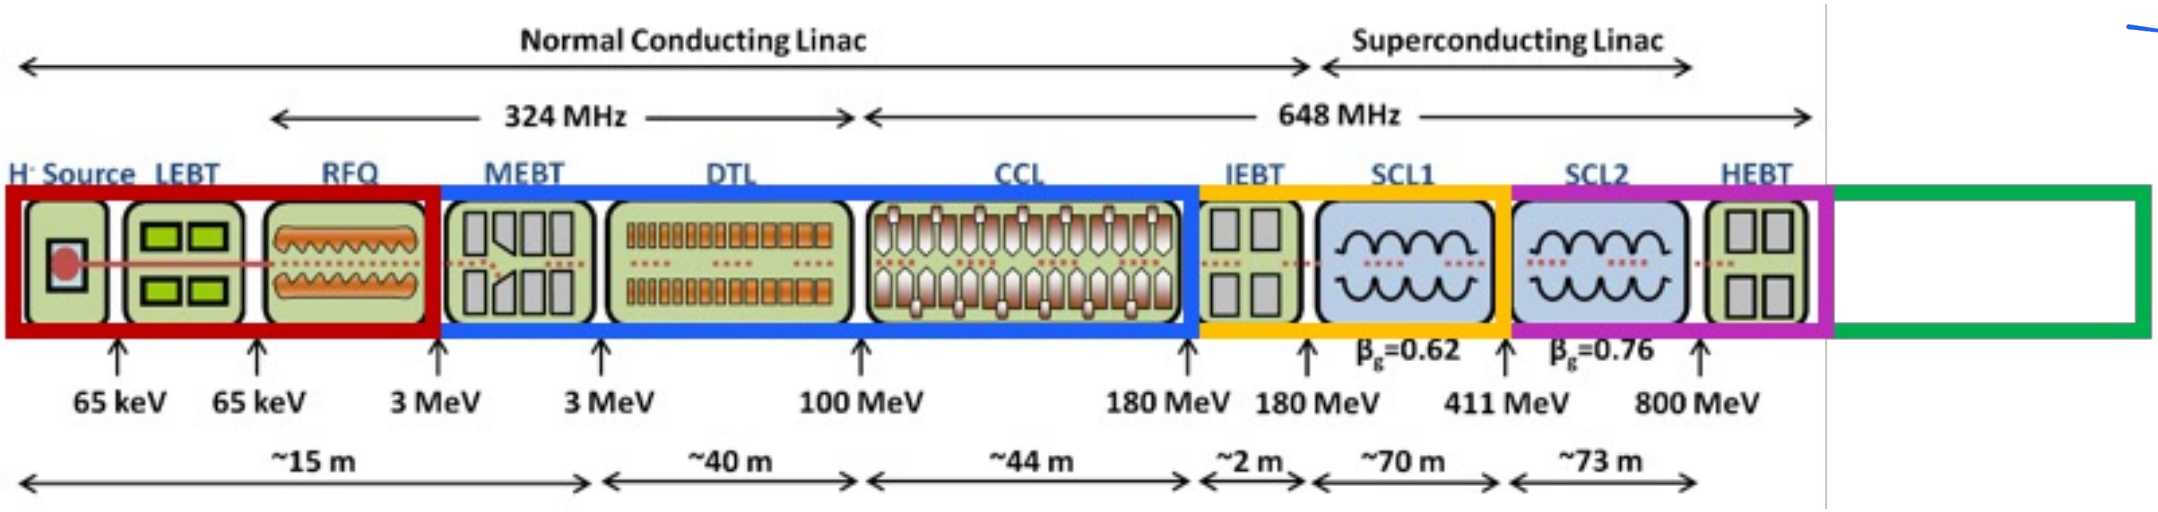
- Low energy linac with RCS
- Low energy linac with FFA
- Full energy linac with AR
- Fall back option: 180 MeV linac upgrade to ISIS

- Modelled using ISIS-II expectation and ancillaries used worldwide (SNS, ESS,...)



10s ktCO$_2$

LINAC shielding proposal.



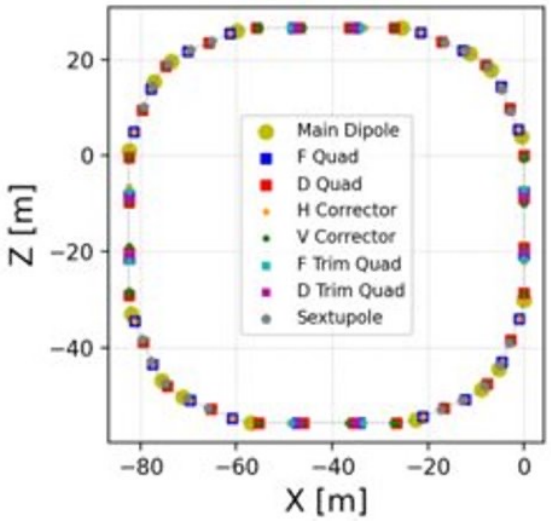
LINAC design proposal.

Compression rings (options)

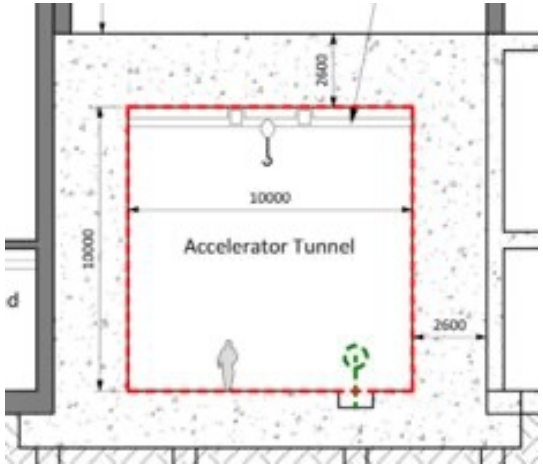
A first look at environmental impacts is underway.

Lattice magnet design differs in AC and DC currents therefore power distribution varies between a RCS and AR, however total power consumption will be similar.

Options will be considered in depth in LCA in the near future.



RCS magnets proposal.

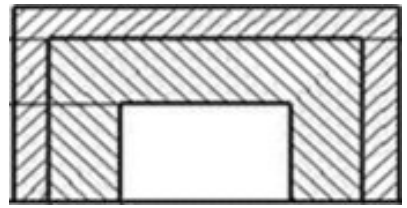


10s ktCO$_2$

Ring tunnel and outer shielding proposal.

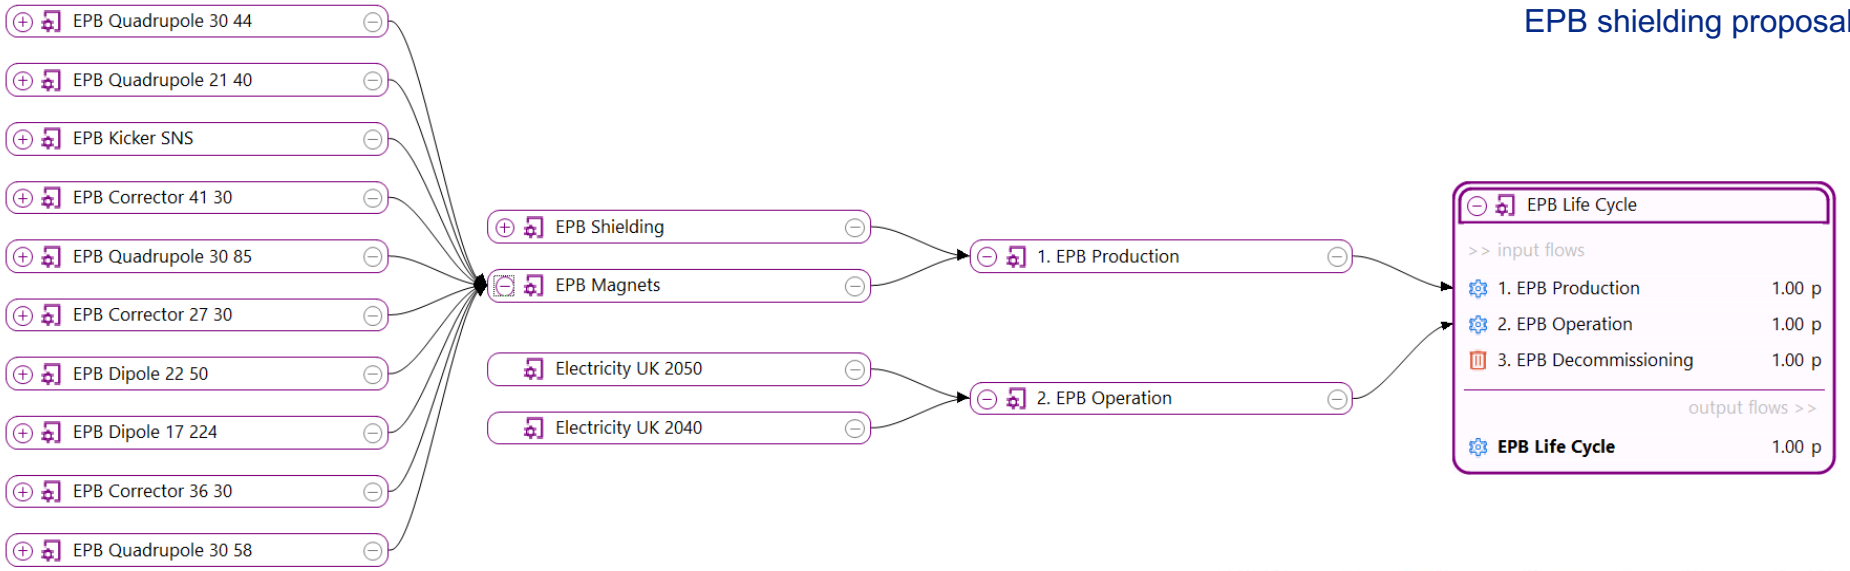
Extraction Proton Beamlines (EPBs)

- The EPBs design is modelled using the SNS Ring to Target Transport Line (RTBT) design.

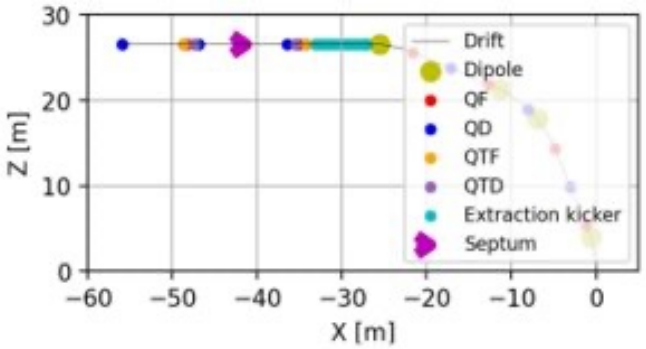


100s $ktCO_2$

EPB shielding proposal.



- Designs for ISIS-II are in progress and models will be updated when available.

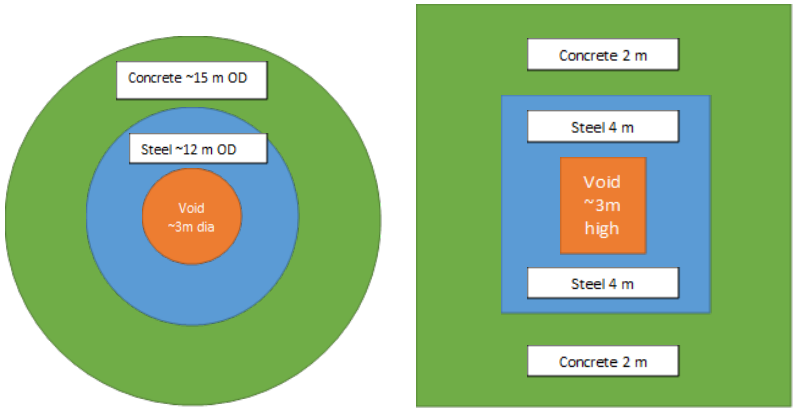


Targets

- TS1: water and H-decoupled moderators
- TS2: top pancake H, bottom H rods.

- Current design suggestions either
  - Target Station basically a copy of ISIS or
  - ~1 MW target station (similar to SNS STS).

- Important consideration here is the target material, radiation damage and replacement rate of the target.



10s $ktCO_2$

Target monolith
(shielding) proposal.

Instruments

- ISIS-II is proposed to host 26 – 40 instruments (by ~10 year mark).
- STFC recently succeeded in gaining funding for the Endeavour program at RAL. Endeavour instruments and ESS instruments are state-of-the-art and are not expected to change significantly in technology over the construction timescale of ISIS-II.
  - Therefore, these can be used as a model for instrument impacts.

- One model for neutron (HRPD-X) and one for muon (SuperMuSR) instruments due to differences in construction.
- Cherry-pick the more usual components.
- ISIS instrument and laboratory gas consumption each year recorded through gas canister orders used as a first estimate.

- How do we expect the data rates to change? How will ISIS-II data scale compare to, say, CERN/ESS?

Ancillaries

- Such as Klystrons, power sources, etc.
- Are being modelled individually using information from suppliers where possible,
- Where not possible, estimations will be made using existing facilities (SNS, ESS, …)

- Studies will be performed to determine optimal ancillaries in terms of environmental impact.
- These can then be considered in design stages.

Construction: Concrete

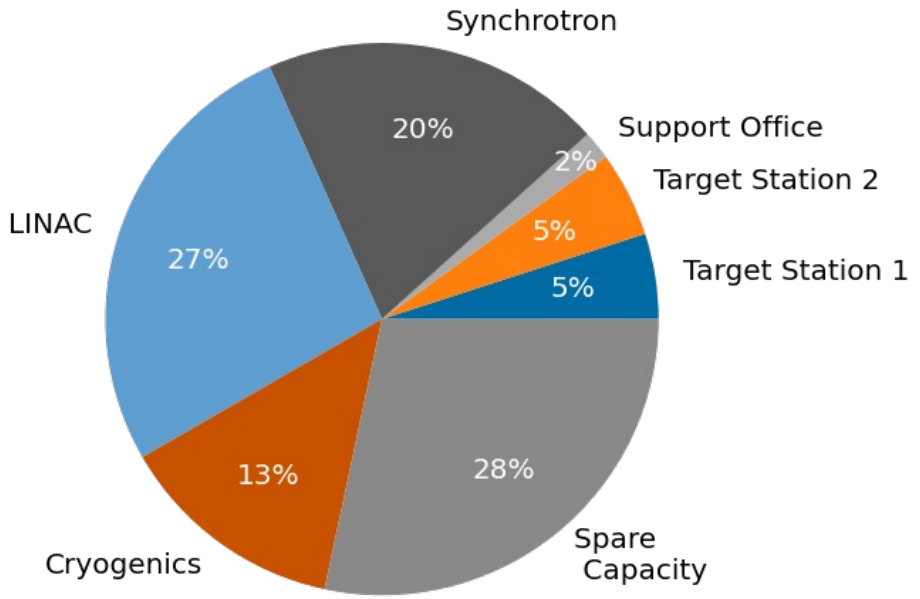
One of the largest expected environmental impacts is of the use of concrete in construction of ISIS-II. At this stage in the analysis, it is expected that emissions of CO2e are expected to be of a similar order of magnitude of the power consumption of ISIS-II over its entire lifetime!

Thus efforts are ongoing to evaluate the potential for the use of more environmentally friendly materials.

Operation: Power

A first estimation of the emissions of CO2e due to the power consumption of ISIS-II over its lifetime.

Power	Big Science Scheme	
	[MVA]	Lifetime CO2e [tCO2e]
Target Station 1	1.5	30,156
Target Station 2	1.5	30,156
Support Office	0.5	10,052
Synchrotron	6	120,625
LINAC	8	160,834
Cryogenics	4	80,417
Spare Capacity	8.5	170,886
TOTAL	**30**	**603,126**



Big Science Scheme

The power values are assumed to reflect the predicted beam on/off ratio of ISIS-II and present the 60-year operational lifetime CO2e impact of ISIS-II, including current predicted "decarbonization of the UK grid" estimates.

Operation: Power (Computing)

The emissions of CO2e due to the power consumption and materials use of computing of ISIS-II over its lifetime is in the process of being modelled.

It is expected that the computing requirements compared to ISIS will be much larger.

Estimation work is ongoing, but it - as one of the largest power consumers in High Energy Physics - deserved a mention!

Operation: Local travel

Using ISIS local transport data, a first “back of envelope” calculation
is performed (i.e. high level of uncertainty)

Assumptions:

- 2026 estimates of staff modes of travel and distance travelled,
- 2022 percentages of onsite staff per day,
- 2050 estimates of public transit decarbonisation, and guesstimate of 2050 car emissions.

ISIS and ISIS-II permanent staff predictions:
Now: ~ 580 staff
2024-28: ~ 640 staff
2028-32: ~ 700 staff
2032-45: ~ 1050 staff
2045-2100: ~ 700 staff

A first estimation expects

~2 $ktCO_2$

for the lifetime of ISIS-II.

Operation: User travel (national and international)

Using ISIS user transport data, a first “back of envelope” calculation is performed
(i.e. high level of uncertainty)

Assumptions:

- 25% of users are international:
  Italy, The Netherlands, Sweden, Japan.

ISIS and ISIS-II user predictions:
Now: ~ 3500 visitors per annum
2040+: ~3500 visitors per annum

A first estimation expects:

~2.4 $ktCO_2$

Emitted by national users through travel

~2.2 $ktCO_2$

Emitted by international users through travel

Decommissioning

- ISIS-II decommissioning 2100 – 2170 (decay storage limit of 70 years).

- Estimation of the radioactive waste at ISIS-II will be modelled using:
  - the ISIS radioactive waste and disposal records,
  - Plans for ISIS decommissioning (2045-2090)
  - expected radioactive waste at ISIS-II,
  - other facilities of higher beam energy's estimations of waste (ESS).
- Highly dependent on country.

A first look at specific areas of environmental impact of ISIS-II

Area	Estimated carbon emissions from power consumption [$ktCO_2e$]	Estimated embodied carbon from buildings [$ktCO_2e$]	Estimated carbon emissions from tunnelling [$ktCO_2e$]	Estimated carbon emissions from shielding materials [$ktCO_2e$]
Target Station 1	30			~15
Target Station 2	30			~15
Support Office	10			-
Synchrotron	120			~10
LINAC	160		~10	~40
Cryogenics	80			-
Spare Capacity	170			-
Other (inc. support hall, EPBs)	-			~150
TOTAL	**~600**	**~100**	**TBC + ~10**	**~230**

NB: More studies ongoing and to come!

Overall environmental impact of ISIS-II

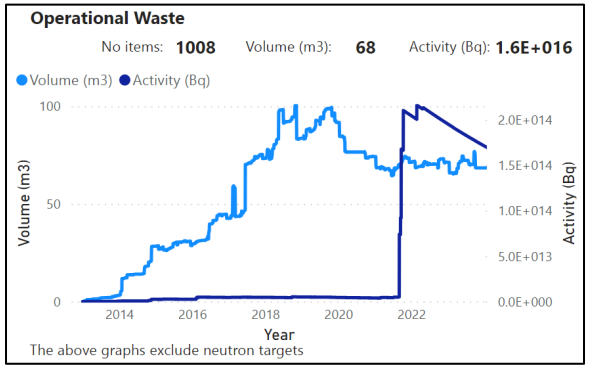
Costs

		Quantity	Unit	£/rate	£ Total
Demolition and Site Clearance					
Site strip and levelling		151,700	m2	30.0	4,550,000
Disposal		151,700	m2	50.0	7,590,000
Mounding to new structure		53,550	m2	90.0	4,820,000
Sub-total		151,700		111.8	16,960,000
Linac and transfer tunnels					
Linac Tunnel		,455	m2	6,935.5	127,995,000
Beam Transfer		7,470	m2	13,332.3	99,592,300
MEP - Linac		18,455	m2	1,664.5	30,717,690
Sub-total	G/A	18,455	m2	13,996.5	258,304,990
Synchotron					
Synchotron		9,850	m2	14,999.3	147,742,800
MEP - Synchotron		9,850	m2	1,263.3	12,443,629
Sub-total		9,850	m2	16,262.6	160,186,429

Construction

Element	Electrical Allowances [MVA]	
	Big Science Scheme	180 MeV Scheme
Target Station 1	1.5	1.5
Target Station 2	1.5	N/A
Support office	0.5	N/A
Synchrotron	6	As existing
LINAC	[illegible]	2
Cryogenics	4	2
Spare Capacity	3	1
Total	24.5	6

Operation

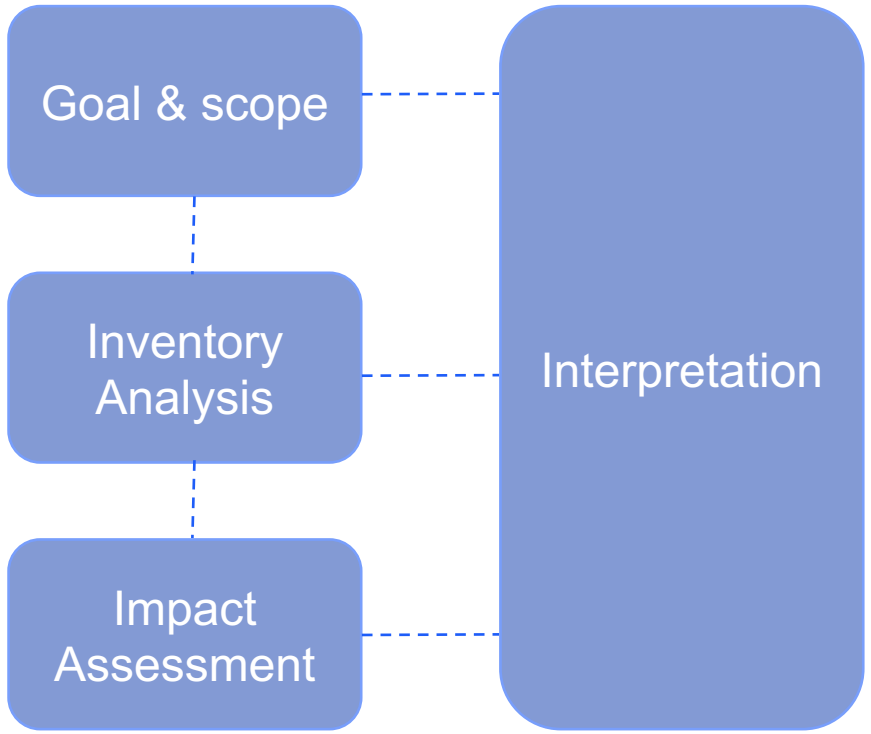


Decommissioning

What's next?

Life Cycle Assessment of ISIS-II

Life Cycle Assessment/Analysis (LCA):



LCA steps.

Goal & Scope

Goal

- To evaluate and inform the design of ISIS-II with a comparison of the options available for the compression rings of ISIS-II.

Scope

- The 4 ring design options of ISIS-II:
  - **RCS (low energy LINAC)**
  - FFA (low energy LINAC)
  - **AR (full energy LINAC)**
  - Fall back option: 180 MeV LINAC upgrade to ISIS
- Initially CO_2e is used as assessment parameter but other environmental impacts will not be ignored and not deemed negligible for the comparison.
- Currently the functional unit is "ISIS-II", with the view to investigate updating this in the future to, e.g., "user hours".

Inventory Analysis

Data collection and quality control:

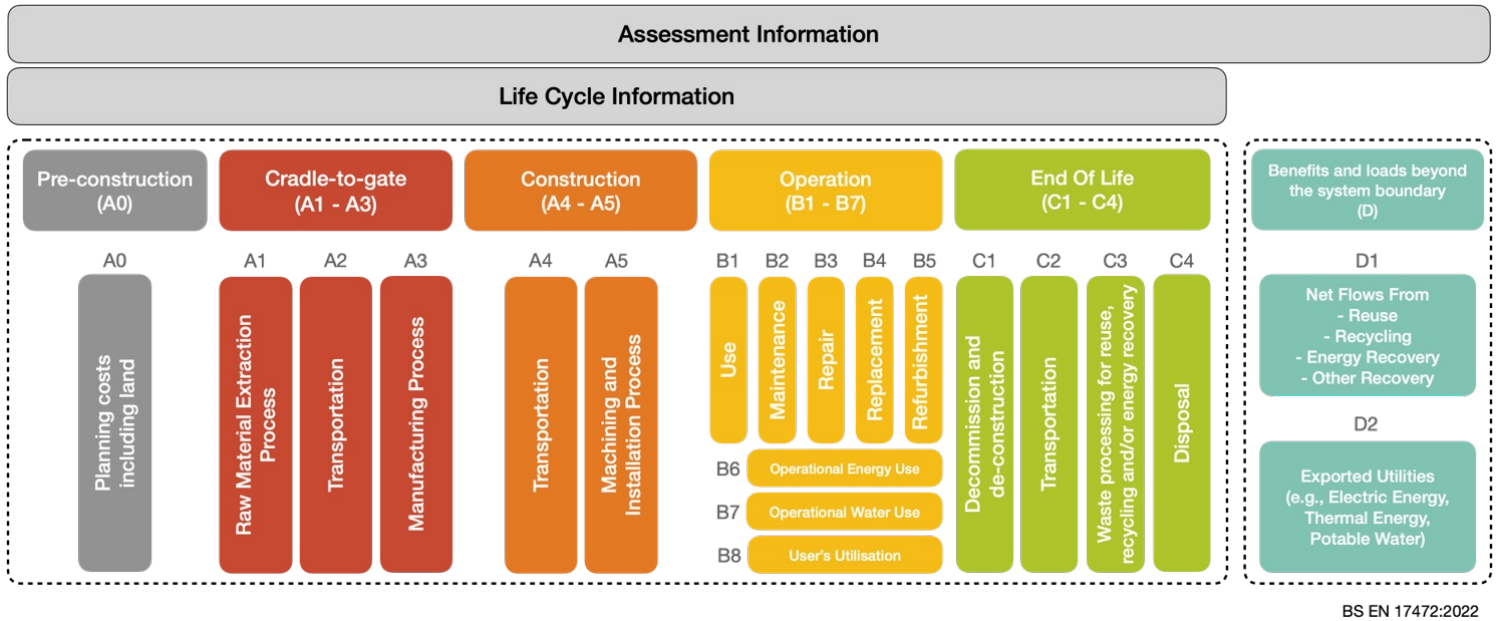
- **Construction**
- Facility
- Machine
- Shielding
- Computing
- Location

- **Operation/Active life**
- Energy consumption
- Resource consumption inc. leakage
- Failure likelihoods/risks inc. replacement/repair

- **Decommissioning**
- Storage of radioactive materials

Input
(resources, materials, semi-products, products)
vs.
Output
(emissions, waste, valuable products)

Impact Assessment



BS EN 17472:2022

A. Construction
B. Operation
C. Decommissioning

- Following the EN 17472:2022 standard as a basis.
- Using the ReCiPE:2016 Midpoint (H) Life Cycle Impact Assessment Method.
- Using openLCA with the Idemat database (currently, fluid, incomplete database for study)
  - One good outcome of this: naturally creates a database with key particle accelerator components such as magnets.

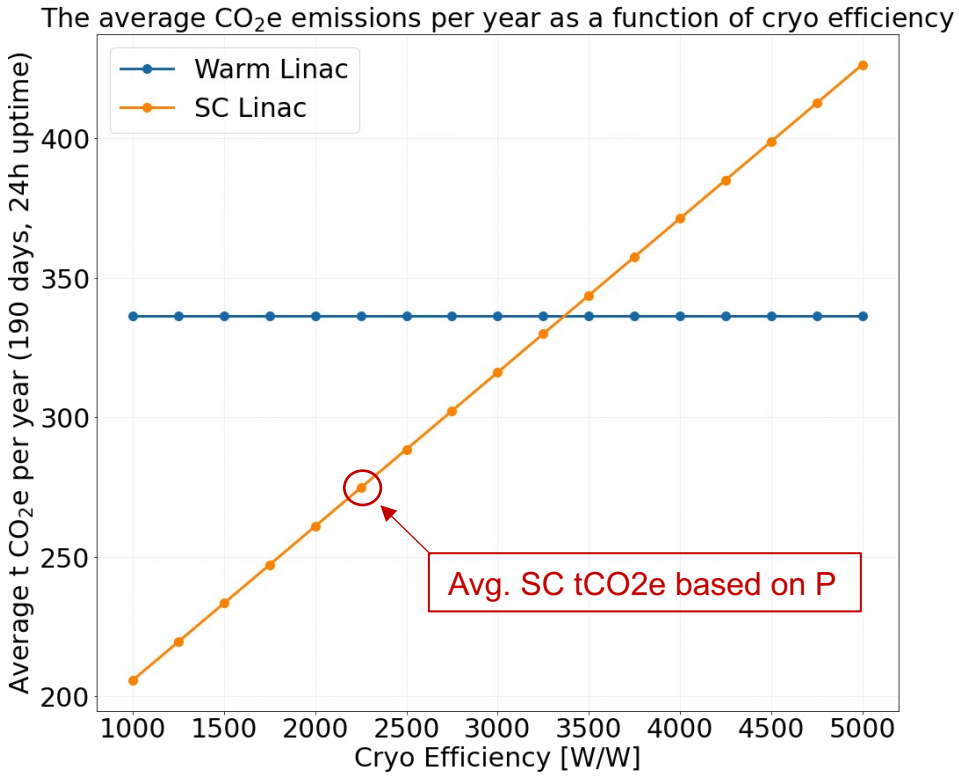
Summary and Conclusion

- Understanding and reducing the environmental impact of fundamental research is necessary.
- ISIS-II is the next proposed upgrade to the ISIS Neutron and Muon Source facility in the UK.
- To evaluate the environmental impact of ISIS-II, an impact analysis is well underway.
- To inform the design options for ISIS-II and the next funding bid, a Life Cycle Assessment will be performed.

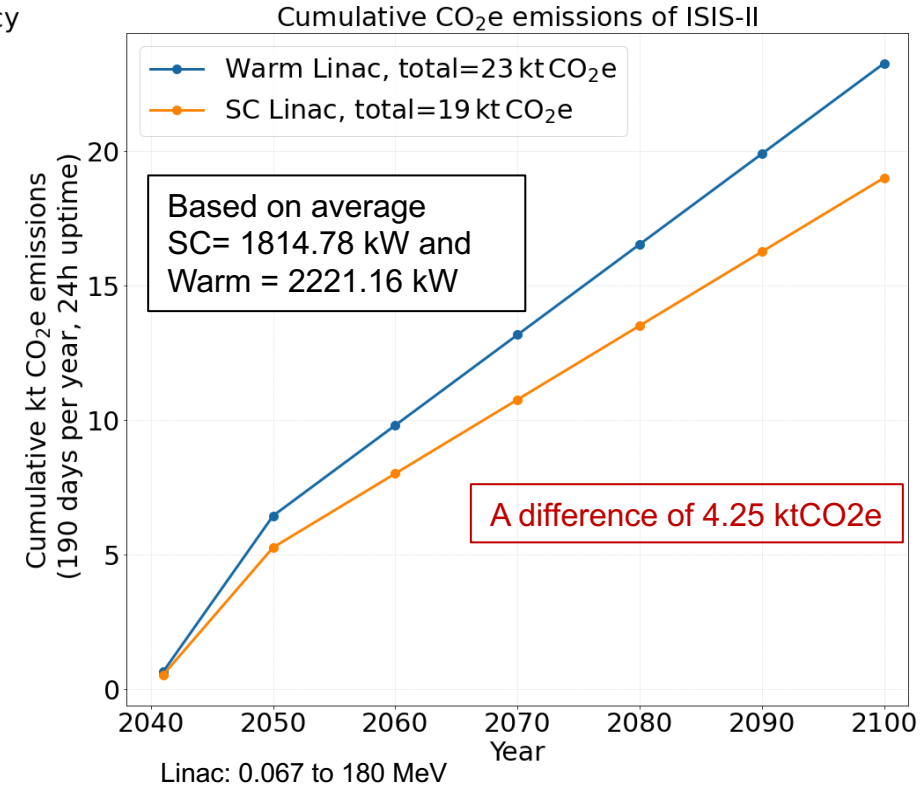
Thank you for your attention, questions welcome!

hannah.wakeling@physics.ox.ac.uk

Operation: a comparison of warm LINAC and SC LINAC
(From A. Letchford's efforts)



Comparison of warm and SC LINAC as a function of cryo efficiency
(using 2050 energy CO2e emissions per kWh)



Cumulative CO2e emissions with comparison of SC vs. warm LINAC using total wall plug power (note **k**t CO2e)

Year	CO_2 emissions [t CO_2/ kWh]
2020	1.415×10^{-4}
2030	8.51×10^{-5}
2040	6.36×10^{-5}
2050	3.32×10^{-5}

Decommission: Radiation

Would the use of Zepto-magnets have an increased radiation impact due to the large use of Neodymuim?

- Perhaps not a bad as originally feared.
- Ability to recycle (and the corresponding decay storage time needed) will be sensitive to the Co-60 activity with a half-life of ~5 years, just as it is with conventional electromagnets.

NB: The only way to accurately know what will form in a magnet is to model it properly with activation codes.
