## Luminosity in colliders

The performance of a collider is typically evaluated by the luminosity $(\mathscr{L})$ achieved. It is a proportional factor between the cross section ( $\sigma_{p}$ ) and the number of interaction per unit of time $\frac{d R}{d t}$,

$$
\frac{d R}{d t}=\mathscr{L} \times \sigma_{p}
$$

Analytically the luminosity writes,

$$
\mathscr{L}=f_{\mathrm{rev}} n_{b} \frac{n_{1} n_{2}}{4 \pi \sigma_{x} \sigma_{y}} S
$$

with $S$ the geometric factor that counts for the loss of luminosity due to the crossing scheme (other correction factors are omitted here).
Is this effect neglilible? Some numbers ${ }^{1}$

$$
\begin{aligned}
& \text { LHC } 4 \mathrm{TeV}(2012) \rightarrow S=0.84 . \\
& \text { LHC } 7 \mathrm{TeV}(2015) \rightarrow S=0.82 . \\
& \text { LHC } 7 \mathrm{TeV}(2023) \rightarrow S \sim 0.37 \\
& \text { CLIC } 1.5 \mathrm{TeV}(? ? ?) \rightarrow S=0.10 .
\end{aligned}
$$

Way to recover from this loss? Crab crossing

[^0]
## Crab Cavities to recover Luminosity

－The crab cavity concept was first proposed by R．Palmer ${ }^{2}$ for linear collider to recover head on collisions and avoid luminosity loss．A crab cavity is a deflection cavity operated with a $90^{\circ}$ phase shift（crabbing）．
－However for LHC was only considered from late mid－2000．First beam physics reviewed paper，

## Crab Cavities to recover Luminosity

- The crab cavity concept was first proposed by R. Palmer ${ }^{3}$ for linear collider to recover head on collisions and avoid luminosity loss. A crab cavity is a deflection cavity operated with a $90^{\circ}$ phase shift (crabbing).
- However for LHC was only considered from late mid-2000. First beam physics reviewed paper,
- The voltage needed depends on the relative position CC-IP, crossing angle and RF frequency.

$$
V_{\mathrm{CC}}=\frac{\frac{\theta_{c}}{2} E_{0} c}{R_{12}^{\mathrm{CC}-\mathrm{IP}} q \omega_{\mathrm{RF}}}
$$

[^2]
## CC in HiLumi LHC

- One of the key ingredients of the HiLumi LHC is the use of crab cavities to recover $\mathscr{L}$. Tests with beam in the SPS are planned from 2016.
- 3 compact crab cavities under design. Different geometries. 3 MV , 400 MHz .

■ Due to lack of axial symmetry they present high order multipolar components of the main field. The $\Im$ part of the multipoles is zero within the accuracy of the calculation i.e. $\phi_{\text {RFmult }}=0$. But in phase with the main crabbing mode.

■ Analytical evaluation of the optical aberrations showed a non neglilible tune shift for QWCAV.

- Two scenarions considered: $\mathrm{H}_{\text {IP5 }}-\mathrm{V}_{\text {IP1 }}$ and $\mathrm{H}_{\text {IP5 }}-\mathrm{H}_{\text {IP1 }}$.

Figure: RWCAV (left), QWCAV (middle), 4RCAV (right).
Table: RF Multipoles for $\mathrm{V}_{\mathrm{cc}}=10 \mathrm{MV}$ in $\left[\mathrm{mTm} / \mathrm{m}^{\mathrm{n}-1}\right]$.

|  | MBRC | RWCAV | QWCAV | 4RCAV |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{b}_{2}$ | 55 | 0 | 114 | 0 |
| $\mathrm{~b}_{3}$ | 7510 | 3200 | 1260 | 900 |
| $\mathrm{~b}_{4}$ | 82700 | 0 | 1760 | 0 |
| $\mathrm{~b}_{5}$ | $2.9 \times 10^{6}$ | $-0.52 \times 10^{6}$ | $-0.15 \times 10^{6}$ | $-2.44 \times 10^{6}$ |
| $\mathrm{~b}_{6}$ | $52 \times 10^{6}$ | 0 | $-1.66 \times 10^{6}$ | 0 |
| $\mathrm{~b}_{7}$ | $560 \times 10^{6}$ | $-140 \times 10^{6}$ | 0 | $-650 \times 10^{6}$ |

- Two scenarions considered: $\mathrm{H}_{\text {IP5 }}-\mathrm{V}_{\text {IP1 }}$ and $\mathrm{H}_{\text {IP5 }}-\mathrm{H}_{\text {IP1 }}$.
- Tune shift,

$$
\left|\Delta Q_{x, y}\right|=\frac{1}{4 \pi} \beta_{x, y} \frac{b_{2}}{B \rho}
$$

- Tune shift with amplitude,

$$
\left|\Delta Q / J_{x}\right|=\frac{3}{8 \pi} \beta_{x, y}^{2} \frac{b_{4}}{B \rho} .
$$

- Chromaticity shift,

$$
\begin{aligned}
& \left|\Delta \xi_{x, y}\right|=\frac{1}{4 \pi} D_{x} \frac{2 b_{3}}{B \rho} \beta_{x, y} \\
& \left|\Delta \xi_{x, y}\right|=\frac{1}{4 \pi} D_{y} \frac{2 a_{3}}{B \rho} \beta_{x, y}
\end{aligned}
$$

- Coupling,

$$
\begin{aligned}
& \left|\Delta Q_{\min }\right|=\sqrt{\beta_{x} \beta_{y}} \frac{2 b_{3}}{B \rho} D_{y} \sigma_{\delta} \\
& \left|\Delta Q_{\min }\right|=\sqrt{\beta_{x} \beta_{y}} \frac{2 a_{3}}{B \rho} D_{x} \sigma_{\delta}
\end{aligned}
$$

Hor $\quad b_{n}=\left(b_{2}, b_{3}, b_{4}\right)$

## Single RF Multipole Element Implementation in SixTrack

- First time ever long term stability studies including CC RF multipoles.
- They were modeled and included in the SixTrack code up to octupolar component.

Normal Quadrupole
$\Delta x^{\prime}=-b_{2} x \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{quad}}\right)$
$\Delta y^{\prime}=b_{2} y \cos \left(\frac{\omega z^{c}}{c}+\phi_{s}+\phi_{\text {RF,quad }}\right)$
$\Delta \delta=\frac{b_{2}}{2}\left(x^{2}-y^{2}\right) \sin \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \text { quad }}\right) \frac{\omega}{c}$
Normal Sextupole
$\Delta x^{\prime}=-b_{3}\left(x^{2}-y^{2}\right) \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\text {RF,sext }}\right)$
$\Delta y^{\prime}=2 b_{3} x y \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{sext}}\right)$
$\Delta \delta=\frac{b_{3}}{3}\left(x^{3}-3 x y^{2}\right) \sin \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{sext}}\right) \frac{\omega}{c}$
Normal Octupole
$\Delta x^{\prime}=-b_{4}\left(x^{3}-3 x y^{2}\right) \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{oct}}\right)$
$\Delta y^{\prime}=b_{4}\left(3 x^{2} y-y^{3}\right) \cos \left(\frac{\omega z^{c}}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{oct}}\right)$
$\Delta \delta=\frac{b_{4}}{4}\left(x^{4}-6 x^{2} y^{2}+y^{4}\right) \sin \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{oct}}\right) \frac{\omega}{c}$

Skew Quadrupole

$$
\begin{aligned}
& \Delta x^{\prime}=-b_{2} y \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{quad}}\right) \\
& \Delta y^{\prime}=-b_{2} x \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{quad}}\right) \\
& \Delta \delta=b_{2} x y \sin \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, q u a d}\right) \frac{\omega}{c}
\end{aligned}
$$

Skew Sextupole
$\Delta x^{\prime}=-2 b_{3} x y \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{sext}}\right)$
$\Delta y^{\prime}=b_{3}\left(y^{2}-x^{2}\right) \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \text { sext }}\right)$
$\Delta \delta=-\frac{b_{3}}{3}\left(y^{3}-3 y x^{2}\right) \sin \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\text {RF,sext }}\right) \frac{\omega}{c}$
Skew Octupole
$\Delta x^{\prime}=-b_{4}\left(y^{3}+3 x^{2} y\right) \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{oct}}\right)$
$\Delta y^{\prime}=-b_{4}\left(3 y^{2} x-x^{3}\right) \cos \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{oct}}\right)$
$\Delta \delta=b_{4}\left(x^{3} y-y^{3} x\right) \sin \left(\frac{\omega z}{c}+\phi_{s}+\phi_{\mathrm{RF}, \mathrm{oct}}\right) \frac{\omega}{c}$

## HL-LHC DA Simulations w CC RF mult: H-V xing scheme

- Dynamic Aperture is the boundary of the stable motion in circular accelerators. It is determined by massive tracking campaigns where particles are tracked during $10^{5}$ turns at different initial amplitudes and angles.

■ Two scenarios: 1) perfect machine and 2) with errors and corrections are applied to IRs and ARCS (60 seeds).

■ In a $\mathrm{H}_{\text {IP5 }}-\mathrm{V}_{\text {IP1 }}$ crossing scheme the overall tune shift due to the $\mathrm{b}_{2}$ is cancelled for the QWCAV.

## HL-LHC DA Simulations w CC RF mult: H-H xing scheme

- In a $\mathrm{H}_{\text {IP5 }}-\mathrm{H}_{\text {IP1 }}$ the large tune shift will produce resonance crossing with a significant drop of the DA ( $\sim 11 \sigma$ )

Conclusion: high order multipoles can affect significantly the LHC DA either direct tune shift ( $\mathrm{b}_{2}$ ) or feed down effects. First rough alignment tolerances (simulations not shown here) provided,

- QWCAV (only HV) $\left|\mathrm{d}_{\mathrm{x}, \mathrm{y}}\right|<2 \mathrm{~mm}$

■ RWCAV (HH or HV) $\left|\mathrm{d}_{\mathrm{x}, \mathrm{y}}\right|<0.75 \mathrm{~mm}$

- 4RCAV (HH or HV) $\left|\mathrm{d}_{\mathrm{x}, \mathrm{y}}\right|<2.7 \mathrm{~mm}$

## Compact LInear Collider (CLIC)

Multi- $\mathrm{TeV}^{+}-\mathrm{e}^{-}$collider ( 2 beam acceleration $\rightarrow$ accelerating gradient $100 \mathrm{MV} / \mathrm{m}$ )

## Traveling Waist Regime in CLIC FFS

We observed in simulations an unexpected loss of luminosity of $\Delta \mathscr{L} / \mathscr{L}_{\text {headon }} \sim-10 \%$. After careful study this loss was explained from the evolution of the beam waist during the collision or traveling waist regime ${ }^{4}$. This effect is explained from the aberrations induced due to a $z$-dependent off-center horizontal orbit in the Final Focus sextupoles produced by the crab cavity.

$$
\frac{\partial w_{y}}{\partial z}=-\beta_{y}^{*} \sum_{i}^{\mathrm{n}_{s}} \sum_{j}^{\mathrm{n}_{c c}} R_{12}^{\mathrm{CC}_{j}-\text { sext }_{i}} \beta_{y_{i}} \xi_{c} K_{i} L_{i} .
$$

Figure: Left case w/o E-z correlation from the linac and right with correlation.

[^3]
## Traveling Waist Scheme at CLIC Final Focus

Traveling waist in motion!

## Fixing the problem

Three options: 1) change the main linac+BDS orientation to revent the crossing angle, 2) place the CC in a more convenient place from optics point view and 3) adding a second CC (less prefered).

## Fixing the problem

Three options: 1) change the main linac+BDS orientation to revent the crossing angle, 2) place the CC in a more convenient place from optics point view and 3) adding a second CC (less prefered).

[^4]
## Conclusions

- Crab cavities are proved to be indispensable to recover head on luminosity in the presence of crossing angle.
- CCs are one of the main ingredients of the next HiLumi LHC. CC beam dynamis are progressing accordingly.
- CC design should aim for low high order multipoles to avoid optics distortions.
- The crossing scheme at CLIC previously a free parameter is now fixed to avoid luminosity loss. This study was recently approved by PRSTAB for publication.
