## cea <br> Proton beam profile monitor @ ESS

MOTIVATIONS:
Perfect beam alignment in order to:
$>$ Maximize protons on target
$>$ Prevent beam losses ©
$\Downarrow$

REQUIREMENTS:
$>$ Must stand high proton beam intensity
> Minimum impact on proton beam

IONIZATION PROFILE MONITORS
( 1 in Spokes, 3 in Medium $\beta, 1$ in High $\beta$ )

## cea <br> Ionization Profile Monitors (IPMs)

PRINCIPLE OF OPERATION

FEASIBILITY STUDIES (F.S.):
$>\mathrm{Nb}$ of ion/pairs per pulse?
$>$ Electric field uniformity (A. Vnuchenko)
> Space charge effect
F.S. (1/10): ion/electrons pairs expected

ESS PROTON BEAM PARAMETERS:
> Energy: $\quad[90,2000] \mathrm{MeV}$
> Current peak: $\quad 62.5 \mathrm{~mA}$
> Pulse length: 2.86 ms
> Pulse frequency: 14 Hz (duty cycle 4\%)
> Bunch frequency: 352.21 MHz and 754.42 MHz

## IPM GAS PARAMETERS:

$>$ Composition: $\mathrm{H}_{2}$ ( $79 \%$ ), $\mathrm{CO}(10 \%), \mathrm{CO}_{2}(10 \%), \mathrm{N}_{2}(1 \%)$
$>$ Pressure: $\quad 10^{-9} \mathrm{mbar}$
$>$ Mean Ion. Pot.: 35.65 eV

$$
\begin{gathered}
\left.-\left\langle\frac{d E}{d x}\right\rangle=T_{\max }=\frac{2 m_{e} c^{2} \beta^{2} \gamma^{2}}{1+2 \gamma m_{e} / M+\left(m_{e} / M\right)^{2}} \beta^{2}-\frac{\delta(\beta \gamma)}{2}\right] \\
T_{\max }=\frac{2 m_{e} c^{2} \beta^{2} \gamma^{2}}{1+2 \gamma m_{e} / M+\left(m_{e} / M\right)^{2}}
\end{gathered}
$$

Proton energy loss in the gas

| Proton energy (Mev) | Pairs lam/s |
| :---: | :---: |
| 90 | 103235 |
| 216 | 55531 |
| 561 | 33769 |
| 2000 | 26150 |

## cea <br> F.S. (2/10): electric field uniformity

## ELECTRIC FIELD INTENSITY CONSTRAINTS:

> Below spark threshold
$>$ Avoid proton beam deviation
> Avoid emittance growth
$>$ Uniformity needed on planes perpendicular to the electric field
> "Identity" needed among planes perpendicular to proton beam

## SIMULATIONS OF THE ELECTRIC FIELD UNIFORMITY MADE BY A. VNUCHENKO WITH COMSOL:

COMSOL Multiphysics is a platform for physics-based modelling and simulation tools for electrical, mechanical, fluid flow, chemical and other applications.
A numerical technique (finite element method) is used to find approximate solutions to boundary value problems for partial differential equations. FEM solvers generate an optimized mesh and calculate the potential value on it.
a. 2D MODEL OF A SINGLE IPM:
$>E=10 \mathrm{kV} / 10 \mathrm{~cm}$
$>$ Dimensions $=10 \mathrm{~cm} \times 10 \mathrm{~cm}$
$>$ Equally spaced field degrader
$>$ Beam tube radius $=250 \mathrm{~mm}$

F.S. (3/10): electric field uniformity

## cea <br> F.S. (4/10): electric field uniformity

b. 3D MODEL OF A SINGLE IPM:
$>\mathrm{E}=30 \mathrm{kV} / 10 \mathrm{~cm}$
$\Rightarrow$ Dimensions $=10 \mathrm{~cm} \times 10 \mathrm{~cm} \times 4 \mathrm{~cm}$
> 40 Equally spaced field degraders
$>y$ dimension of field degrader $=$ inter field degraders space
$>$ Additional curved electrodes

VARIABLE TO CHECK ELECTRIC FIELD UNIFORMITY:
(Electric field imposed
along the $y$ axis)
$\sigma_{x}=\frac{\sqrt{\left.\Sigma\left(E_{X}\right)^{2}\right)}}{N}$

## F.S. (5/10): electric field uniformity

c. 3D MODEL OF A SINGLE IPM:
$>E \geq 30 \mathrm{kV} / 10 \mathrm{~cm}$
$>$ Dimensions $=10 \mathrm{~cm} \times 10 \mathrm{~cm} \times 10 \mathrm{~cm}$
$>40$ Equally spaced field degraders
> y dimension of field degrader $=$ inter field degrader:

- Additional curved electrodes
- Beam pipe radius $=15 \mathrm{~cm}$
d. 3D MODEL OF 2 IPMs:

## OUTCOME

$>\mathrm{E}=30 \mathrm{kV} / 10 \mathrm{~cm}$
$\Rightarrow$ Cages dimensions $=10 \mathrm{~cm} \times 10.2 \mathrm{~cm} \times 10.2 \mathrm{~cm}$
$>40$ Equally spaced field degraders
$>y$ dimension of field degrader $=$ inter field degraders space
> No curved electrodes
$>$ Vaccum chamber length $=42.8 \mathrm{~cm}$
$\Rightarrow$ Beam pipe radius $=12.2 \mathrm{~cm}$
$>$ Distance between cages $=9 \mathrm{~cm}$
$>$ Distance between chamber wall and first IPM $=12.6 \mathrm{~cm}$
$>$ Distance between chamber wall and first IPM should be increased to avoid spatks $\rightarrow$ Flange should be moved (Unfortunately the VC PDR refused)
F.S. (6/10): Space charge

## REMINDER:

## POSSIBLE CORRECTION METHODS

$>$ High electric field $\checkmark X$
$>$ Add magnetic field $X$
$>$ Software correction $\Omega$

## SOFTWARE CORRECTION

R. Wanzenberg, Nonlinear Motion of a Point Charge in the 3D Space Charge Field of a Gaussian Bunch.

A Gaussian bunch with total charge $\mathbf{Q}_{b}$ is moving with the velocity $\mathbf{v}_{b}$ along the z-axis of the laboratory frame K .
The electric field of the bunch is calculated in the comoving frame and transformed into an electric and magnetic field in the laboratory frame K where the Lorentz-Force on a point charge $\mathbf{Q}_{0}$ is calculated.

## cea <br> F.S. (7/10): Space charge

## CODES:

$>$ MATLAB (C. Thomas)
$>C++$ (translation of the MATLAB code)

## SIMULATION STEPS:

> a single electron (or ion) is created in the center of the IPM: $x=\operatorname{Gaus}\left(0, \sigma_{x}\right)$

$$
\begin{aligned}
& \mathrm{y}=\operatorname{Gaus}\left(0, \sigma_{y}\right) \\
& \mathrm{z}=\operatorname{Unif}(-2.5 \mathrm{~mm}, 2.5 \mathrm{~mm})
\end{aligned}
$$

- A proton bunch of total charge $\mathrm{q}=1.1 \mathrm{e}^{+9}$ and kinetic energy $\mathrm{E}_{p}$ is considered
$>$ A time step $d t$ is chosen by the program
$>$ the displacement $d x$ of the electron (or ion) is calculated by solving the motion equation (adaptive Runge Kutta Fehlberg method)
$>$ at every $d t$ passed, the following variable values are saved: $t, x, y, z, v_{x}, v_{y}, v_{z}, a_{x}, a_{y}, a_{z}$, fields info (lab and comoving frame)
$>$ when the y position of the electron (or ion) is larger than $\mathbf{5 ~ c m}$, the simulation stops
$>t$ and $y$ are plotted and fitted with a spline to find the time $t_{\text {stop }}$ when the electrode was reached
$>\mathrm{t}$ and x are plotted and fitted with a spline. $\mathrm{x}\left(\mathrm{t}_{\text {stop }}\right)$ is extracted
$>$ the procedure is iterated $N$ times, to reach a statistical uncertainty of $\left(100 \frac{\sqrt{N}}{N}\right) \%$
F.S. (8/10): Space charge

## EXAMPLE:

$>$ Particle: $\mathrm{e}^{-}$
> Initial particle speed: $0 \mathrm{~m} / \mathrm{s}$
> Proton beam energy: 90 MeV
> Proton beam direction: Z
$>$ |Electric field|: $300 \mathrm{kV} / \mathrm{m}$
$>$ Electric field direction: $-Y$
$>\sigma_{x}=\sigma_{y}=0.5 \mathrm{~mm}$
$>\sigma_{z}=0.75 \mathrm{~mm}$
$>$ Particle: $\mathrm{H}_{2}^{+}$
$>$Initial particle speed: $0 \mathrm{~m} / \mathrm{s}$
$>$ Proton beam energ: 90 MeV
$>$ Direction of the proton beam: Z
$>\mid$ Electric field $\mid: 300 \mathrm{kV} / \mathrm{m}$
$>$ Electric field direction: -Y
$>\sigma_{x}=\sigma_{y}=0.5 \mathrm{~mm}$
$>\sigma_{z}=0.75 \mathrm{~mm}$

$3^{\text {rd }}-4^{\text {th }}$ October 201t

## cea <br> F.S. (9/10): Space charge <br> $-2$

SIMULATION OF 4000 PARTICLE INS THE CHAMBER

F.S. (10): Space charge

Comparison between the initial and final $\times$ position distribution

OUTCOME:
> We are running 1260 simulations
$>$ For ions no space charge issues
$>$ For electrons:
if $\left|E_{y}\right|$ gets higher, no space charge problems if $\left|E_{y}\right| \leq 300000 \mathrm{~V} / \mathrm{m}$, no space charge problems if $\sigma_{x} \geq 3 \mathrm{~mm}$ (for $\left|E_{y}\right|<300000 \mathrm{~V} / \mathrm{m}$ and $\sigma_{x}<3 \mathrm{~mm}$, data still to be analysed...)

STILL TO DO (for space charge):

- Finish running simulations and analyse results
> Check impact of initial electron speed and, in case, re-run sim

Two directions are investigated

## Silicon pixels

Si read-out
(TimePix 3...)

## Read Out

Optical
> sensitive parts to radiations

- MCP
- Scintillating screen
$\rightarrow$ Can be overcome with gain calibration by injecting light through an optical fiber
$\rightarrow$ Once not usable, throw and change it: maintenance?
> contact with Photonis

Silicon pixel matrix
> radiation hard (100 MGy)
> electronic cooling down
$>$ pixel auto calibration (current injection)
> contact taken at Cern

- no beam test before Feb. 2017
- collaboration...

Ability to get profile for each pulse ( 2.86 ms ) : it should be ok for both techniques
Idea: test beam with 2 IPMs equipped with both read-out systems Florian Benedetti, new PhD student starts his position yesterday. He will investigate the read-out purposes.
