

# ISOL Physics in Belgium

Gerda Neyens

Intituut voor Kern- en Stralingsfysica (IKS), KU Leuven, Belgium  
and  
ISOLDE Physics Group Leader, CERN, Zwitserland

**KU LEUVEN**

- The beginning: Leuven Isotope Separator On-Line (LISOL)  
at the Cyclotron Research Centre at Louvain-la-Neuve
- Present: ISOL physics (and applications) at ISOLDE-CERN
- Future: ISOL physics also at SPIRAL2 (GANIL, Caen)

# Cyclotron Research Centre at Louvain-la-Neuve

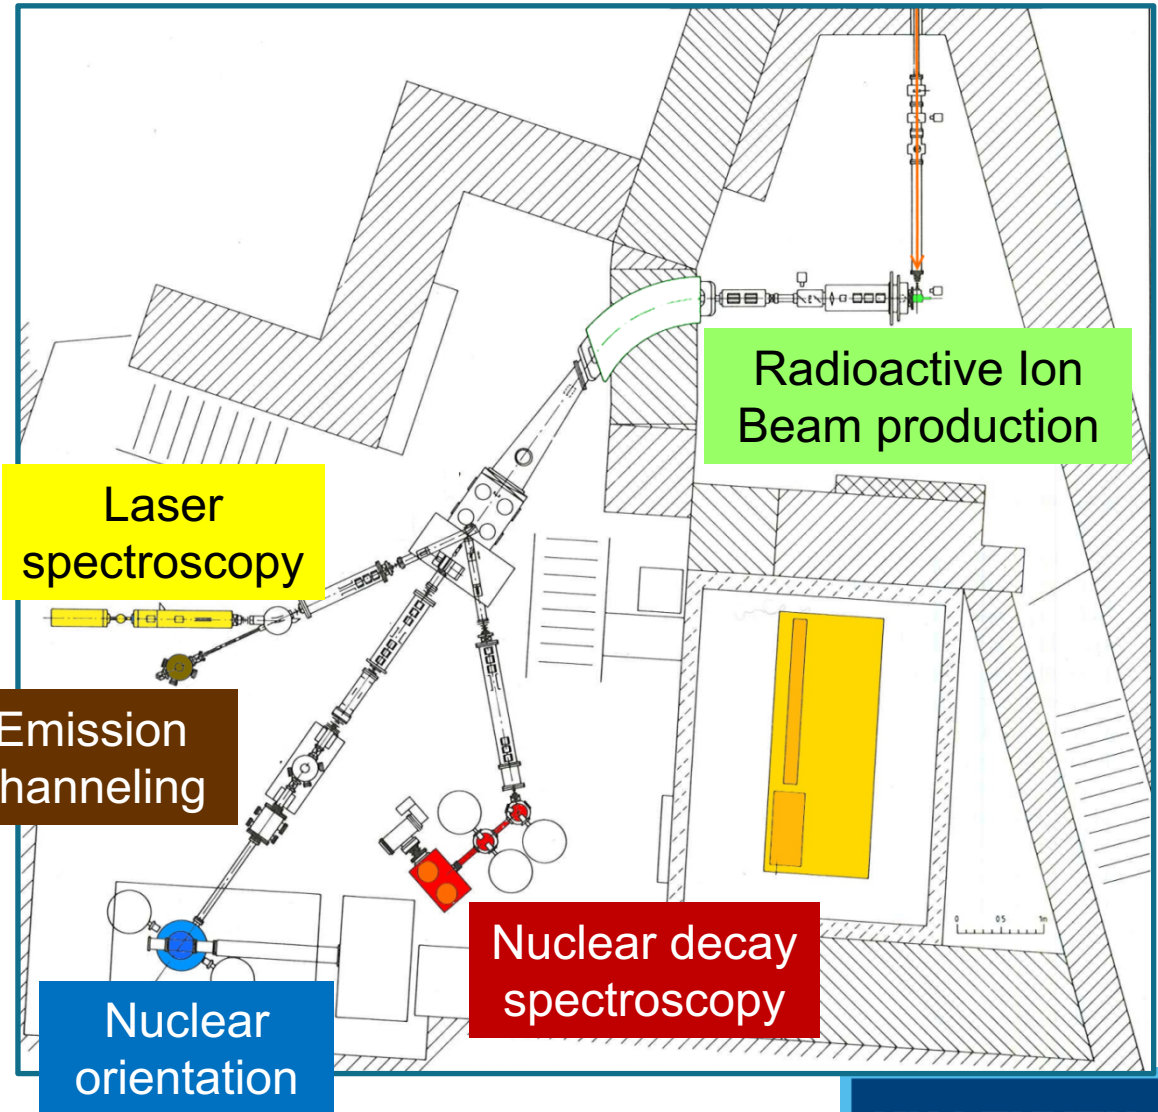

- K=110 cyclotron “Cyclone”
- Programme:
  - nuclear physics research
  - applications
  - neutron therapy
- **LISOL = Leuven Isotope Separator On-Line operational 1974-2014**
- Second cyclotron (1987):  
H<sup>-</sup> 30 MeV, 500 μA
- **Post-accelerated RI beams (1989-2008)**

# Cyclotron Research Centre at Louvain-la-Neuve

## LISOL facility (1974-2014)

- Out present-day research was initiated here:
  - decay spectroscopy
  - ground-state properties  
(laser spectroscopy, nuclear orientation)
  - fundamental interactions  
(nuclear orientation)
  - solid-state physics  
(emission channeling)
- **RIB production:**  
**in-gas recoil from thin target or laser ion source**

# NOW: MOST nuclear physics EXPERIMENTS (90%) at ISOLDE@CERN

CERN accelerators

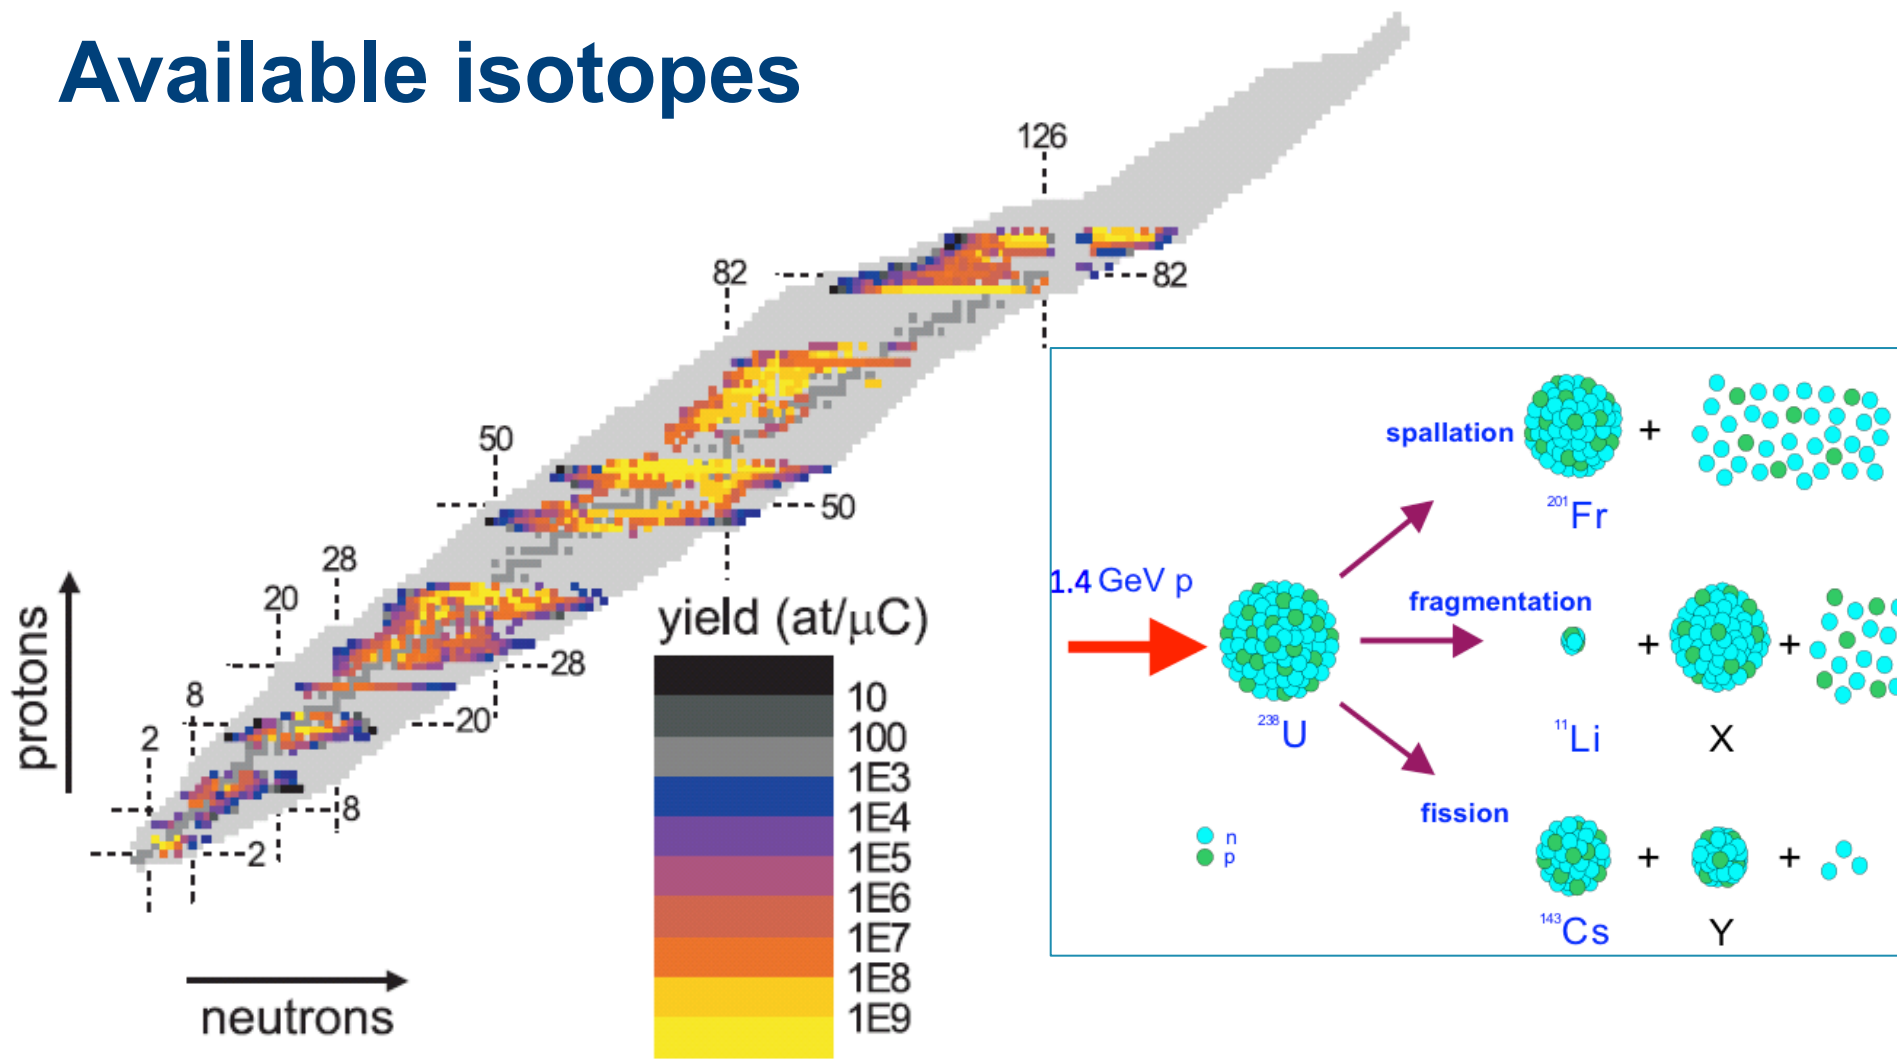

**50% of CERN's produced protons**

Protons, 1.4 GeV  
1.2 10<sup>13</sup> pps

# The ISOLDE facility

# Available isotopes

So far ~ 700 radioactive isotopes of > 60 elements @ 40-60 keV  
> 80 accelerated isotopes (now up to 7 MeV/u)

# Collinear laser spectroscopy at ISOLDE

G. Neyens

Collaboration: KU Leuven, U. Mainz,  
U. Manchester, TU. Darmstadt,  
MPIK Heidelberg, U. Liverpool

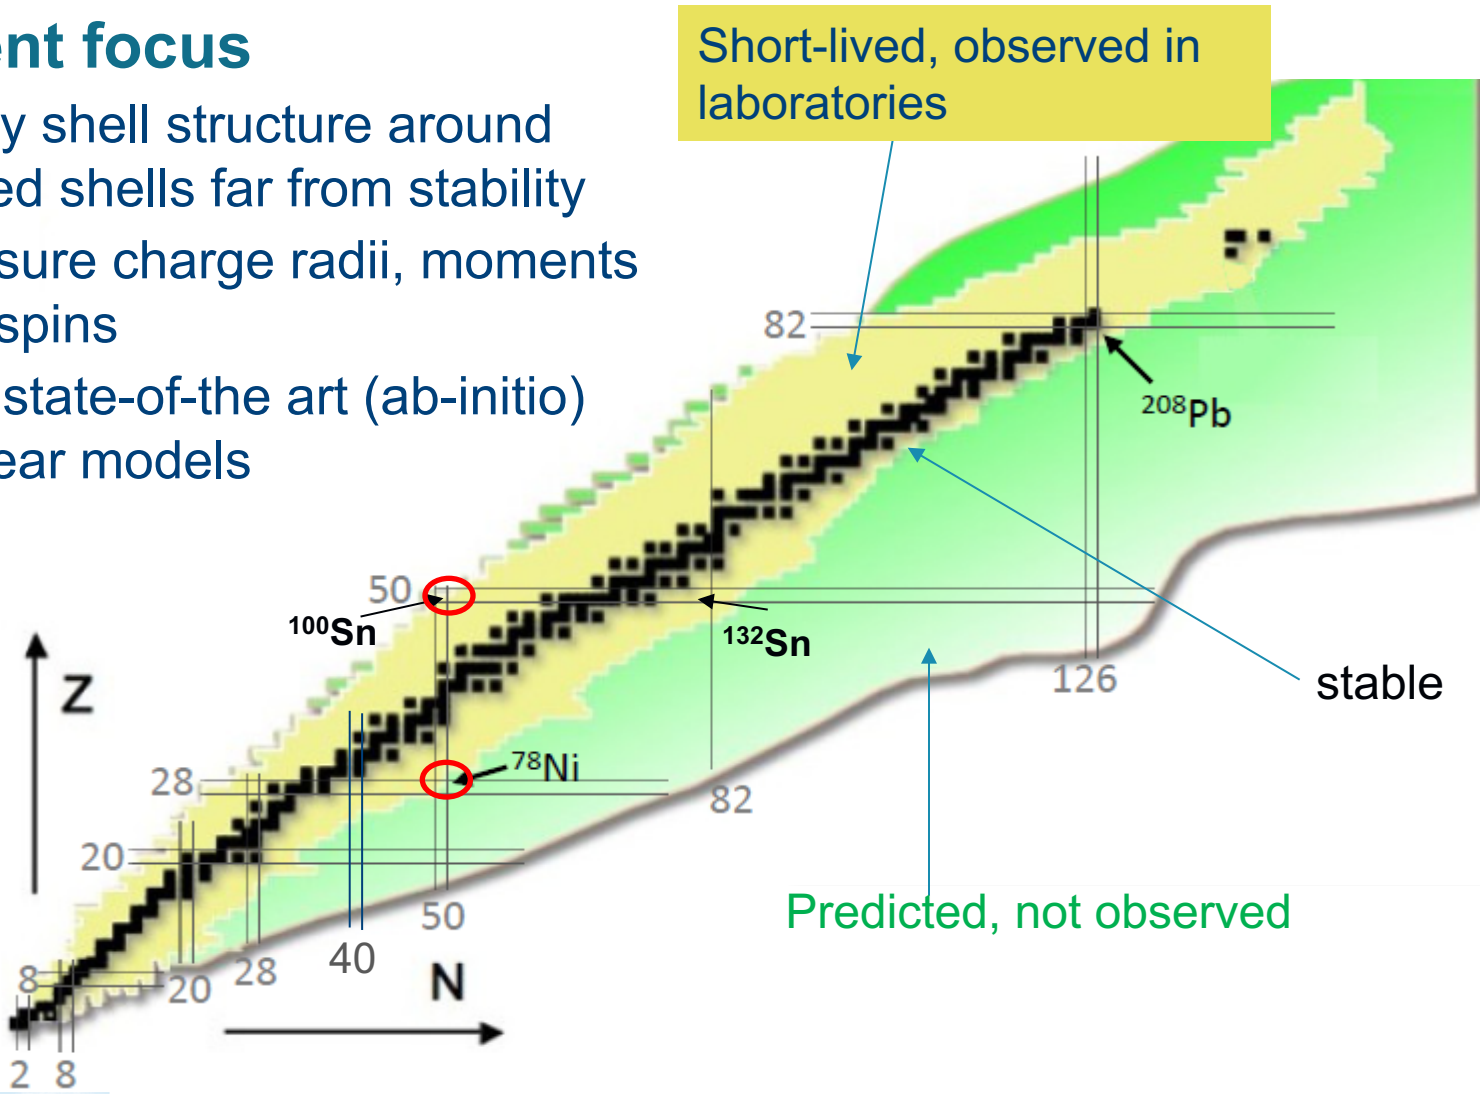

1.4 GeV protons  
from PS booster

Collinear laser spectroscopy  
CRIS and COLLAPS

## Current focus

- Study shell structure around closed shells far from stability
- Measure charge radii, moments and spins
- Test state-of-the-art (ab-initio) nuclear models

# COLLINEAR LASER SPECTROSCOPY

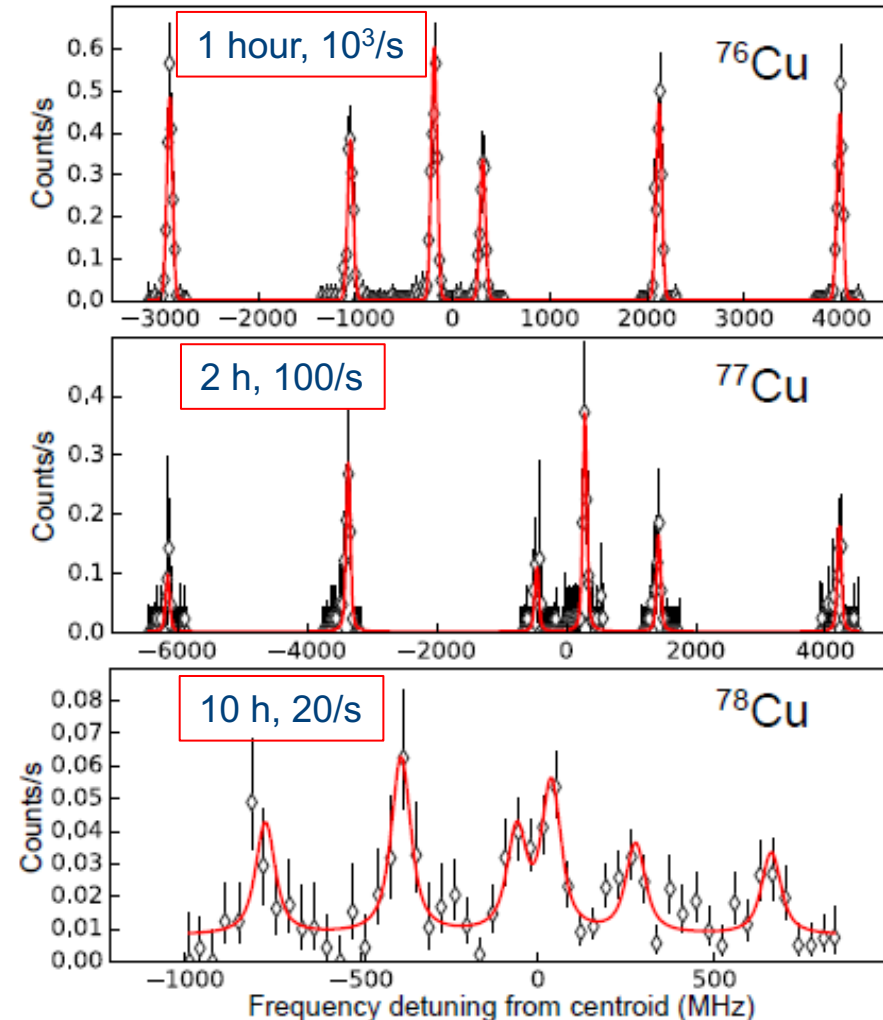

Since 2008 → sensitivity improved by factor 100.000 using CRIS on bunched beams!

## Collinear Resonance Ionization Spectroscopy

- ultra-low background ( 1 event /10 min)
- high efficiency ( $\sim 1-5$  %)
- high resolution ( $\sim 20-60$  MHz)
- current sensitivity 20 ions/s

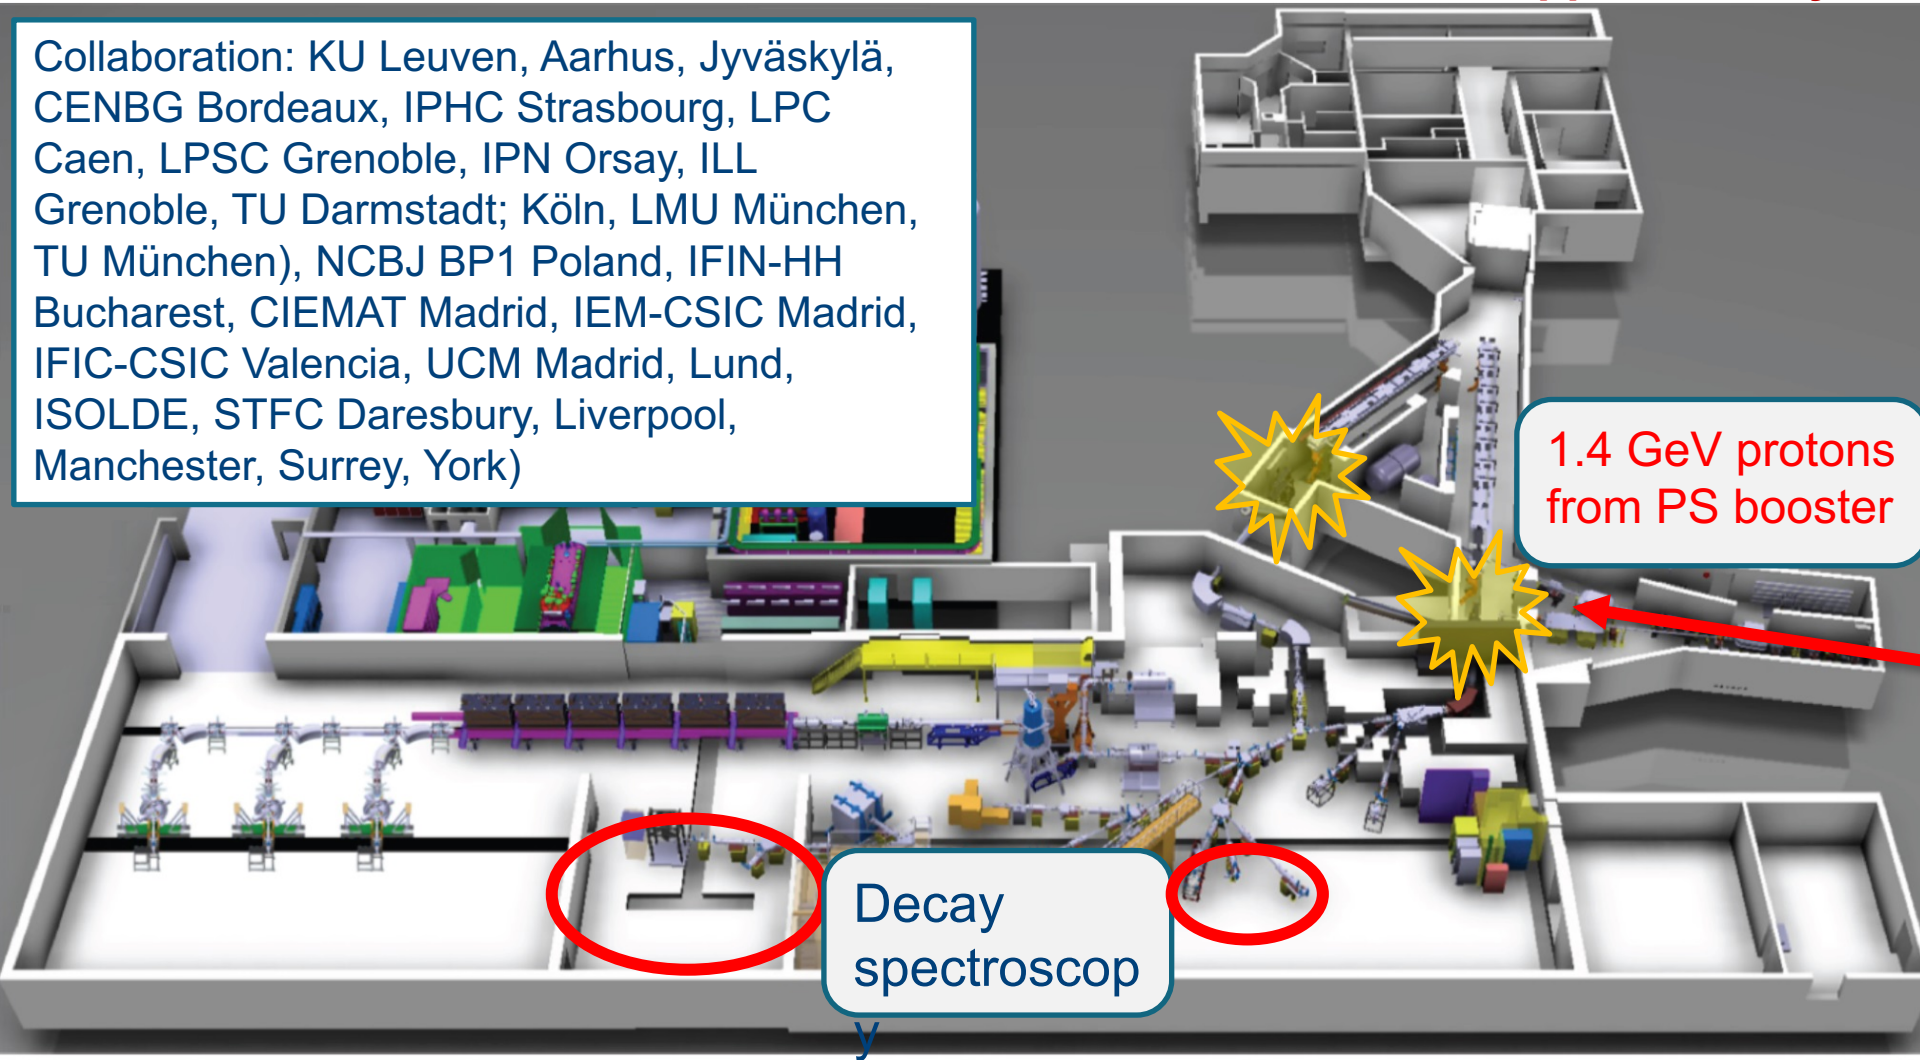

Most recent result @ ISOLDE  
HFS of 63-78Cu  
(R.P. de Groote et al., to be published)

# Decay spectroscopy: ISOLDE Decay Station IDS

P. Van Duppen, M. Huyse

Collaboration: KU Leuven, Aarhus, Jyväskylä, CENBG Bordeaux, IPHC Strasbourg, LPC Caen, LPSC Grenoble, IPN Orsay, ILL Grenoble, TU Darmstadt; Köln, LMU München, TU München), NCBJ BP1 Poland, IFIN-HH Bucharest, CIEMAT Madrid, IEM-CSIC Madrid, IFIC-CSIC Valencia, UCM Madrid, Lund, ISOLDE, STFC Daresbury, Liverpool, Manchester, Surrey, York)

1.4 GeV protons from PS booster

Decay spectroscop

# Decay spectroscopy: ISOLDE Decay Station IDS

P. Van Duppen, M. Huyse

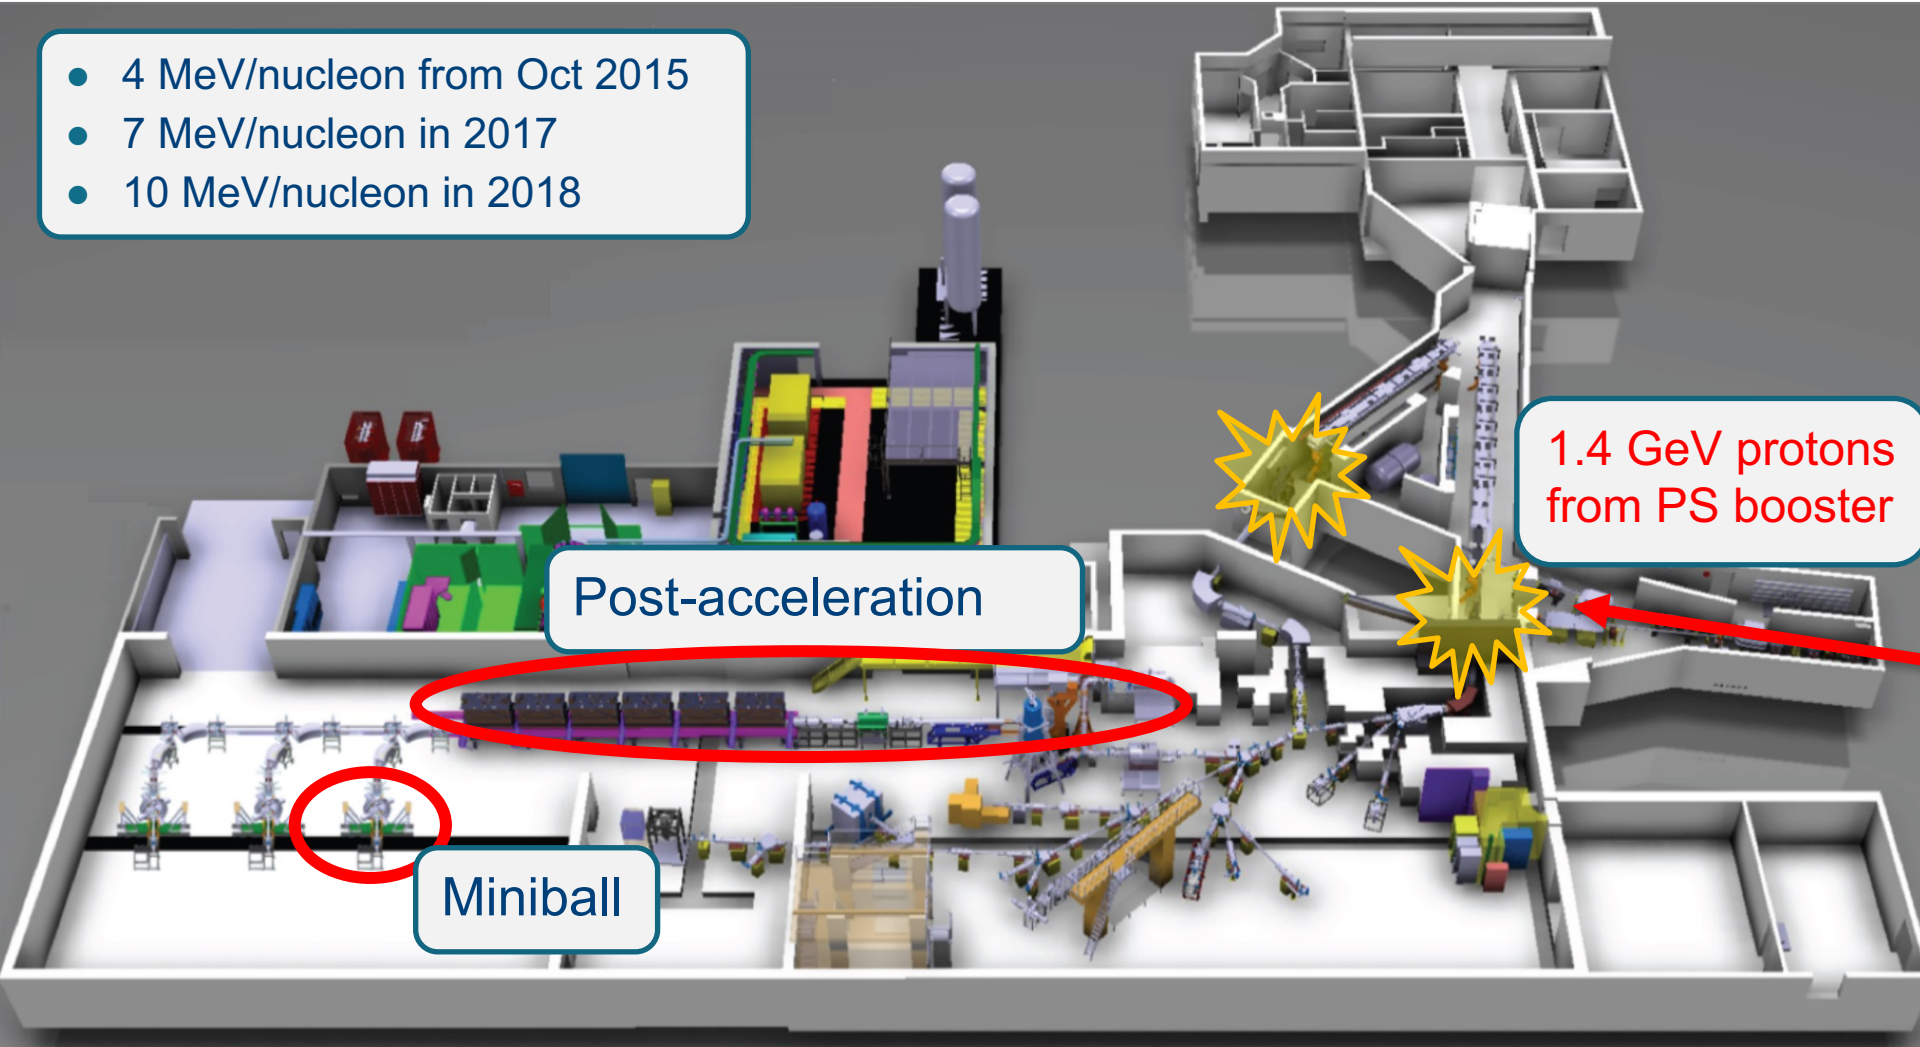

- Permanent, flexible setup
- Tape station
- Ge clovers + Ge Miniball  
+ ancillary: LaBr<sub>3</sub>, neutron  
detectors, silicon detectors
- $\beta$ - $\gamma$ ,  $\alpha$ - $\gamma$ , fast timing,  
electron spectroscopy...
- Focus from our groups:  
n-rich Ni region  
n-deficient Pb region  
asymmetric fission

# Post-accelerated ion beams: HIE-ISOLDE

R. Raabe, P. Van Duppen, M. Huyse

- 4 MeV/nucleon from Oct 2015
- 7 MeV/nucleon in 2017
- 10 MeV/nucleon in 2018

1.4 GeV protons from PS booster

Post-acceleration

Miniball

# Miniball + Si: Coulomb excitation, transfer reactions

R. Raabe, P. Van Duppen, M. Huyse

Miniball Ge detector array

T-rex Si barrel

# HIE-ISOLDE Phase 2 (2017-2018) to 10 MeV/u

Movable  
Setups

ISOL  
Solenoidal  
Spectrometer

MINIBALL

Cd-Si Detector  
T-REX  
SPEDE

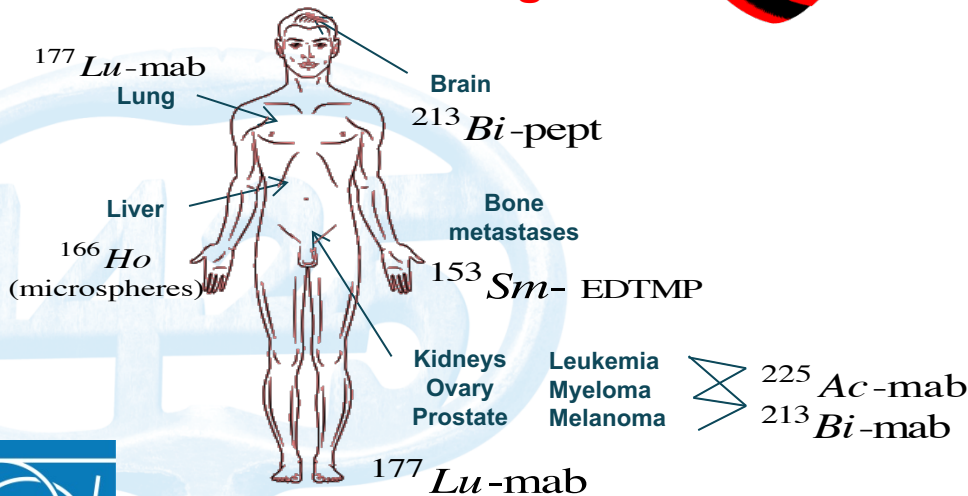

# LISOL separator now at CERN → MEDICIS (2016)

Chemical separation

## S3 Low-Energy Branch of SPIRAL2 at GANIL

- Production at the Super Separator Spectrometer S3 (GANIL)
- Laser resonance ionization spectroscopy in the heavy element region
- Mass measurements, isomeric beams, decay studies...

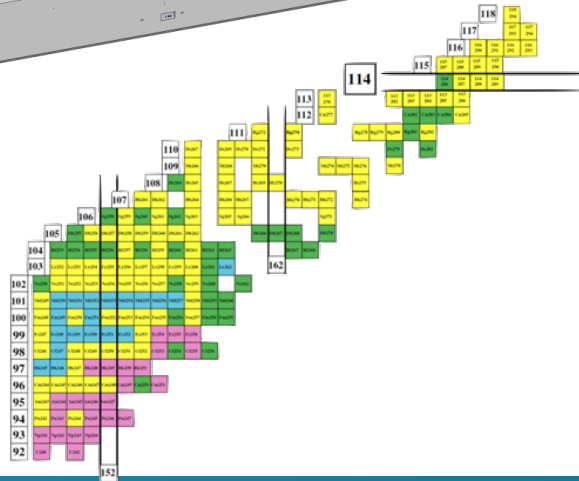

GANIL  
laboratoire commun CNRS/OSQAR

IPN  
INSTITUT DE PHYSIQUE NUCLEAIRE  
ORSAY

loos

JG|U

JYFL

# Neutron EDM experiment at Paul Scherrer Institute

N. Severijns

## Goal:

improve the sensitivity of the neutron Electric Dipole Moment experiment to the  $10^{-27}$  e.cm level

## • Main methods:

- Improvements to ultracold neutron source
- Double neutron precession chamber
- Cs, He and K-based magnetometry

# Summary

- Belgian experimental nuclear physicists have expertise in
  - RIB production and handling (including laser ion sources)
  - decay spectroscopy ( $\alpha$ ,  $\beta$ ,  $\gamma$ )
  - laser spectroscopy and laser polarization
  - Coulomb excitation and direct reactions
  - Ion trapping
- For the study of
  - nuclear structure far from stability (shell evolution, shape coexistence)
  - properties of weak interaction (beyond Standard Model research)
  - nuclear solid state physics (emission channeling, PAC, ...)
